Main Points

This report presents forward projections for the number of households in Scotland's Strategic Development Plan (SDP) areas and National Parks up to 2037, based on the projected population of these areas in the 2012-based population projections.

This covers the following areas:

- Cairngorms National Park (CNP) and Loch Lomond and the Trossachs National Park (LLTNP).
- The four Strategic Development Plan areas of Glasgow & Clyde Valley, Aberdeen City & Shire, Edinburgh & South East Scotland (SESplan), and Dundee, Perth, Angus & North Fife (TAYplan).

Figure 1, below, shows a summary of the projected population and household change in each of these areas, between 2012 and 2037.

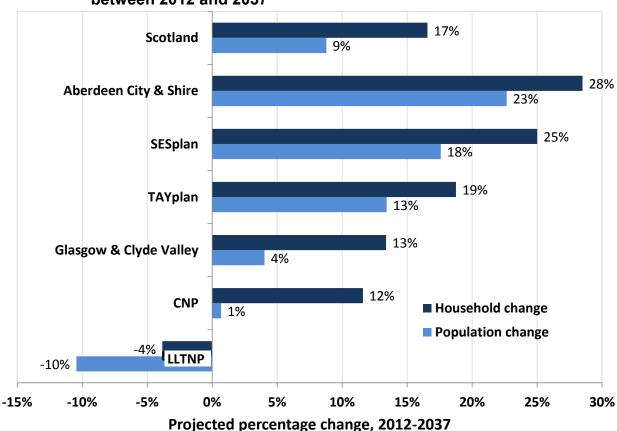

Figure 1: Summary of projected population and household change in each area, between 2012 and 2037

National Parks

- Between 2012 and 2037, the number of households in Cairngorms National Park (CNP) is projected to increase by 12 per cent. The population of CNP is also projected to increase over this period, although not as quickly as the number of households, with the population increasing by one per cent. The average household size in CNP is projected to fall from 2.15 in 2012 to 1.93 in 2037.
- In contrast, the number of households in Loch Lomond and the Trossachs National Park (LLTNP) is projected to decrease by four per cent between 2012 and 2037. The population of LLTNP is projected to decrease more quickly than this with a fall

- of 10 per cent projected over the same period. As in CNP, the average household size in LLTNP is projected to fall, going from 2.16 in 2012 to 2.01 in 2037.
- The decreasing average household size is reflected in the changes in the number of households in each household type. There are projected increases in the number of adults living alone, a 19 per cent increase in LLTNP, and a 26 per cent increase in CNP. There are also projected increases in the number of households containing one adult with children, in both National Parks. There are projected decreases in the number of households containing two or more adults with children, or three or more adults.
- An important driver of decreasing household size is the ageing population, as children tend to live in larger households and older people in smaller ones. Both National Parks are affected by this. CNP has a projected increase of 55 per cent in the number of people in older age groups (65+), while children (aged zero to fifteen) and the 16 to 64 population are projected to decrease by 15 and 14 per cent, respectively. In LLTNP, numbers in the older age groups are projected to increase by 41 per cent, but there are projected decreases in children (a fall of 13 per cent) and the population aged between 16 and 64 (a fall of 29 per cent).
- By 2037, over half of the households in LLTNP, and 44 per cent of households in CNP, are projected to be headed by someone over 65.

Strategic Development Plan Areas

- Between 2012 and 2037, the number of households in all four SDP areas is projected to increase. Aberdeen City & Shire is the SDP area projected to have the largest percentage increase in households (28 per cent), followed by SESplan (25 per cent), TAYplan (19 per cent) and Glasgow & Clyde Valley (13 per cent).
- Over the same period, the population of each SDP area is expected to increase by between four per cent (Glasgow & Clyde Valley) and 23 per cent (Aberdeen City & Shire). Household numbers are projected to increase by more than the population as more people are projected to live alone or in smaller households. In all SDP areas, average household size is projected to decrease between 2012 and 2037, from between 2.16 (TAYplan and Glasgow & Clyde Valley) and 2.24 (Aberdeen City & Shire) in 2012 to between 1.98 (Glasgow & Clyde Valley) to 2.13 (Aberdeen City &Shire) in 2037.
- The decreasing average household size is reflected in the changes in the number of households in each household type. There are large projected increases in households containing just one adult; 32 per cent in TAYplan, 35 per cent in Glasgow & Clyde Valley, 44 per cent in SESplan and 45 per cent in Aberdeen City & Shire. There are also projected increases in two adult households and households containing one adult with children in all SDP areas. In contrast, there are projected decreases in the number of households containing three or more adults in all SDP areas, falling by between eight per cent (SESplan) and 18 per cent (Glasgow & Clyde Valley). The number of households containing two adults with children is projected to decrease in Glasgow & Clyde Valley (falling by 21 per cent) and SESplan (falling by 2 per cent), while increasing in Aberdeen City & Shire (rising by 12 per cent) and TAYplan (rising by one per cent).
- An important driver of decreasing household size is the ageing population, as children tend to live in larger households and older people in smaller ones. All the SDP areas are affected by this. Between 2012 and 2037, the population aged 65 and over is projected to increase by 48 per cent in TAYplan, 58 per cent in Glasgow & Clyde Valley, 67 per cent in Aberdeen City & Shire and 69 per cent in SESplan.

Over the same period the population aged between 16 and 64 is projected to decrease by eight per cent in Glasgow & Clyde Valley and only increase by two per cent in TAYplan, six per cent in SESplan and 11 per cent in Aberdeen City & Shire. The number of children (aged zero to 15) in Glasgow & Clyde Valley is projected to fall by less than one per cent, whereas number are projected to rise by 15 per cent in SESplan, 16 per cent in TAYplan and 27 per cent in Aberdeen City & Shire SDP.

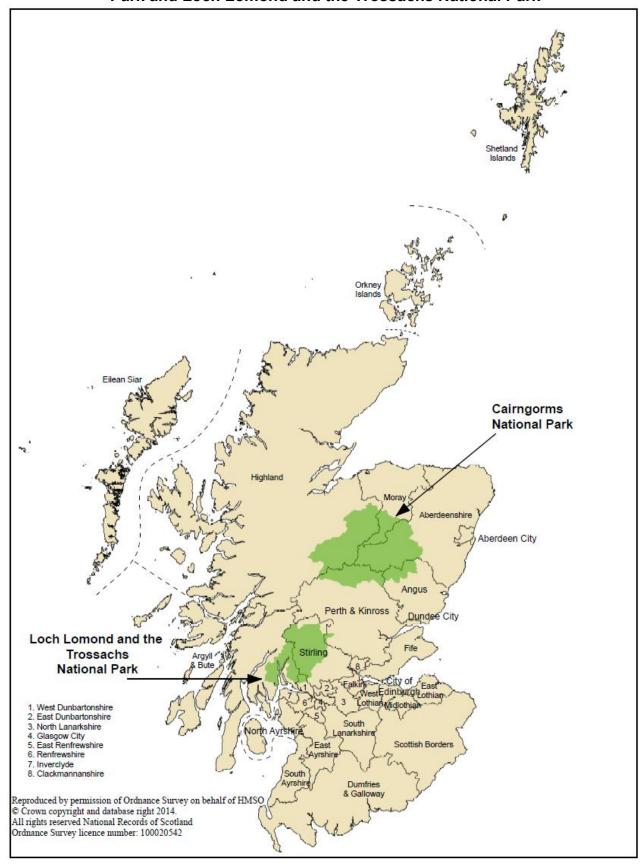

• The ageing population is reflected in the changes in the age of head of household between 2012 and 2037. There are projected increases in the number of households headed by most age groups across the SDP areas, but the largest increases are in the older age groups (65+). These range from increases of 41 per cent in TAYplan to increases of 62 per cent in SESplan. By 2037, around a third of the households in each SDP area will be headed by someone aged 65 or over.

1. Introduction

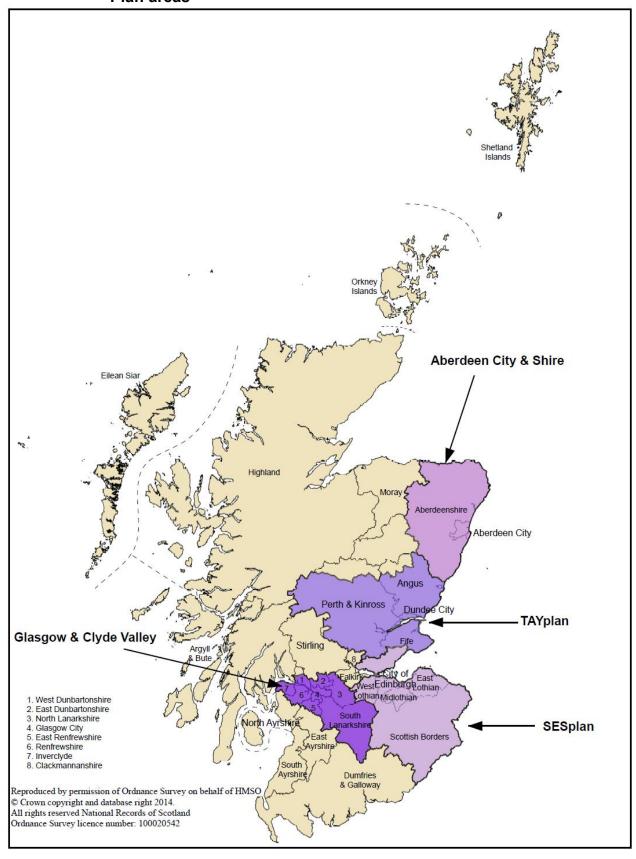

1.1 National Parks and Strategic Development Plan Areas

- 1.1.1 In July 2014, National Records of Scotland (NRS) published on their website the 2012-based household projections for Scotland and for Scotland's Council areas. This follow-up publication presents equivalent figures for Scotland's National Parks and Strategic Development Plan (SDP) areas.
- 1.1.2 National Parks are protected areas of beautiful countryside, wildlife and cultural heritage. There are two National Parks in Scotland: Cairngorms National Park (CNP) and Loch Lomond and the Trossachs National Park (LLTNP). The locations of the National Parks are shown on Map 1. Each National Park is managed by a National Park Authority.
- 1.1.3 The populations of the two National Parks are quite small and forward projections for such small populations are less reliable than for larger communities, especially for the distant future, therefore care must be taken in their interpretation.
- 1.1.4 Strategic Development Plan areas cover the regions around Aberdeen, Dundee, Edinburgh and Glasgow and are shown in Map 2. Around three quarters of the population of Scotland live in these areas.
- 1.1.5 The four Strategic Development Plan (SDP) areas are:
 - Glasgow and the Clyde Valley Strategic Development Plan Area (Glasgow & Clyde Valley SDP area)
 - Aberdeen City and Shire Strategic Development Plan Area (Aberdeen City & Shire SDP area)
 - Edinburgh and South East Scotland Strategic Development Plan Area (SESplan SDP area)
 - Dundee, Perth, Angus and North Fife Strategic Development Plan Area (TAYplan SDP area)
- 1.1.6 Strategic Development Plan areas were created in November 2008 to help with strategic development planning. Strategic Development Plans are prepared by Strategic Development Plan Authorities and set the context for Local Development Plans, prepared by Councils. Together, these plans guide decisions on planning applications. They also inform and co-ordinate decisions on strategic infrastructure investment. In areas outside of SDP areas, including the National Parks, only Local Development Plans are prepared and these are the responsibility of the relevant Council or National Park authority.
- 1.1.7 Further details of National Park and SDP boundaries are given in Section 5.5, including details of the Council areas in each SDP area. More information about SDP areas is also available from Planning Circular 1/2013 on the Scottish Government website.

Map 2: Map of Scotland showing the locations of Strategic Development Plan areas

1.2 Producing the household projections

- 1.2.1 Household projections are produced by the National Records of Scotland (NRS) every two years. As these are the first set of household projections for National Parks and Strategic Development Plan (SDP) areas following the 2011 Census, significant changes have been made to the method used to produce them, reflecting to changes made to the main household projections. The changes have been made to include data from the 2011 Census, as well as the 1991 and 2001 Censuses. Furthermore, the changes provide the flexibility for the projections to incorporate up-to-date survey data on the types of households people are living in, rather than only using census data as in previous sets. The aim of the changes is to incorporate the longer-term trends better, as well as reflecting more recent changes in household formation.
- 1.2.2 This set of projections has been prepared up to 2037, a projection period of 25 years. They incorporate information from the latest (2012-based) population projections and the 2012 and 2013 household estimates (both available on the NRS website). Information from the 1991, 2001 and 2011 Censuses is used to project trends in the types of household that people are living in. Information from a range of sources on residents in communal establishments, such as care homes or prisons, is also incorporated into the projections.
- 1.2.3 Further information on the data and methods used to produce the household projections can be found in Section 5.

1.3 Interpreting the household projections

- 1.3.1 The household projections have limitations. A projection is a calculation showing what happens if particular assumptions are made. The household projections are trend-based and are not, therefore, policy-based forecasts of what the Government expects to happen. They are based on the population projections and trends in household formation. The assumptions used for the population projections, such as future migration, fertility and mortality, will therefore affect the household projections. Trends in household formation are based on data from the 1991, 2001 and 2011 Censuses. No forecast is made of possible future changes that may alter these trends, such as economic and social change, as well as imbalances between housing supply and demand. Projections based on small groups of people or households tend to be less reliable than those based on larger groups. The uncertainty in the projections increases as they are taken further into the future. More information on the limitations of the household projections can be found in Section 6.2.
- 1.3.2 This report focuses on the 'principal projection', that is the projection based on the assumptions that we think are most likely to occur. The report also includes sections on household projections prepared using alternative assumptions. These variant projections reflect possible effects of uncertainty in the assumptions underlying the population projections. Low and high migration variant household projections, which use the low and high migration variant population projections, are presented in Section 3.

1.4 Uses of the household projections

1.4.1 Household projections are mainly used for informing local decisions about future housing need and service provision (such as waste collection and community care).

The projections feed into development plans, including assessments of housing

need and demand for the future¹. The projections are also used to help inform policy development and for answering requests for information by Ministers, councils, academics, other organisations and the general public.

2. Results

2.1 National Parks: Overall number of households

- 2.1.1 The number of households in Scotland is projected to increase from 2.39 million to 2.78 million between 2012 and 2037, an increase of 17 per cent. The number of households in Cairngorms National Park (CNP) is projected to increase from 7,870 in 2012 to 8,780 in 2037, an increase of 12 per cent. In contrast, the number of households in Loch Lomond and the Trossachs National Park (LLTNP) is estimated to be 6,280 in 2012 and then projected to remain roughly constant until 2025, before decreasing to 6,040 household by 2037, a reduction of four per cent over the whole projection period.
- 2.1.2 The household projections are affected by the projected population trends; however, these trends do not entirely explain the changes in the household projections. Between 2012 and 2037, the population of LLTNP is projected to decrease by 10 per cent, a larger decrease than is projected for the number of households. The population of CNP is only projected to increase by one per cent between 2012 and 2037 while the number of households is projected to increase by 12 per cent.
- 2.1.3 These differences between the household and population projections over the projection period are due to more people living alone or in smaller households (Section 2.2). In CNP, the average household size is projected to go from 2.15 people in 2012 to 1.93 people in 2037. The average household size for LLTNP is projected to be 2.16 people in 2012, decreasing to 2.01 people in 2037.
- 2.1.4 Figure 2 shows the household projections for both National Parks from 2012 to 2037. These results can also be found in Table 1.

_

Footnote

¹⁾ Household projections are only one element to be taken into account in assessing future housing need and demand. More information about the planning system in Scotland is available from the <u>Planning Section</u> of the Scottish Government website.

Figure 2: Projected number of households in Scotland's National Parks, 2012 to 2037

2.2 National Parks: Type of household and age of head of household

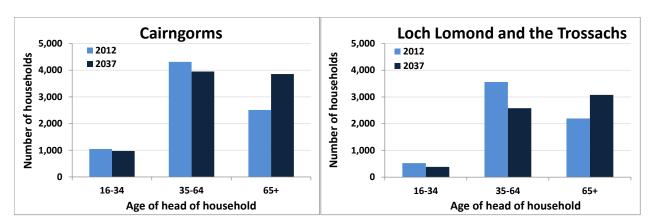

- 2.2.1 As described above, the decline in average household size between 2012 and 2037 results from more people living alone or in smaller households. Figure 3 shows the projected number of households, across different household types, in 2012 and 2037. The largest projected increase in both National Parks (in number and percentage terms) is in households containing one adult only. Households containing one adult with children are also projected to increase in both National Parks. In contrast, the numbers of households containing two or more adults with children, or three or more adults without children, are projected to decrease in both National Parks.
- 2.2.2 Detailed results of the number of households by type can be found in Table 2.

Figure 3: Projected number of households in Scotland's National Parks, by household type, 2012 and 2037

- 2.2.3 The number of households broken down by the age group of the head of household is shown in Table 3 and Figure 4.
- 2.2.4 The population projections show that the population of the National Parks is ageing. Cairngorms National Park (CNP) has a projected increase of 55 per cent in the number of people in older age groups (65+), while in Loch Lomond and the Trossachs National Park (LLTNP) there is a projected increase of 41 per cent. This is reflected in the household projections, with increases shown in households headed by people aged 65 or over in both National Parks. By 2037, more than half of households in LLTNP (51 per cent) are projected to be headed by someone aged 65 or over. In CNP, the share of all households that are headed by someone aged 65 or over also increases, but to less than half (44 per cent).
- 2.2.5 In contrast, the population aged 16 to 64 is projected to decrease by 14 and 29 per cent in CNP and LLTNP respectively. Again this is reflected in the household projections, with households headed by someone aged under 65 projected to decrease in both National Parks.

Figure 4: Projected number of households in Scotland's National Parks, by age of head of household, 2012 and 2037

2.2.6 Projected household numbers for CNP and LLTNP, by household type and age of head of household can be found in Tables 4a and 4b, and Figures 5a and 5b respectively.

Figure 5a: Projected number of households in Cairngorms National Park, by type of household and age of head of household, 2012 and 2037

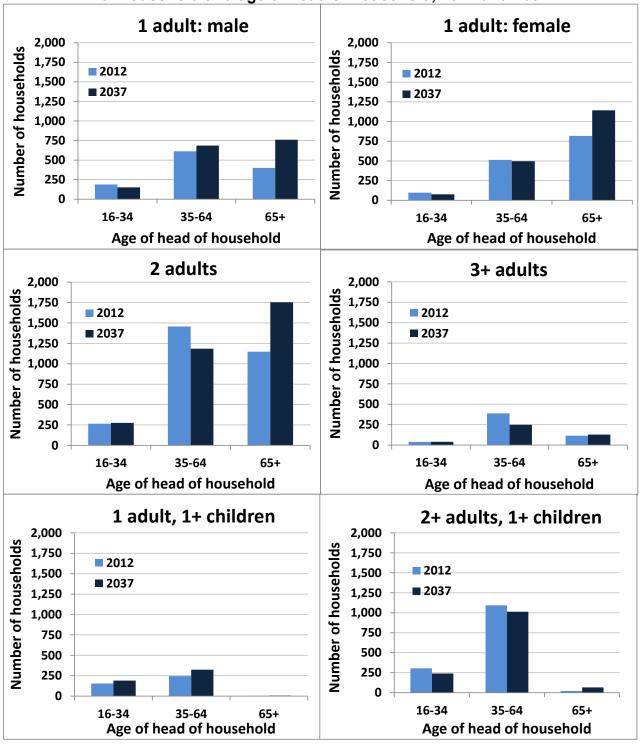

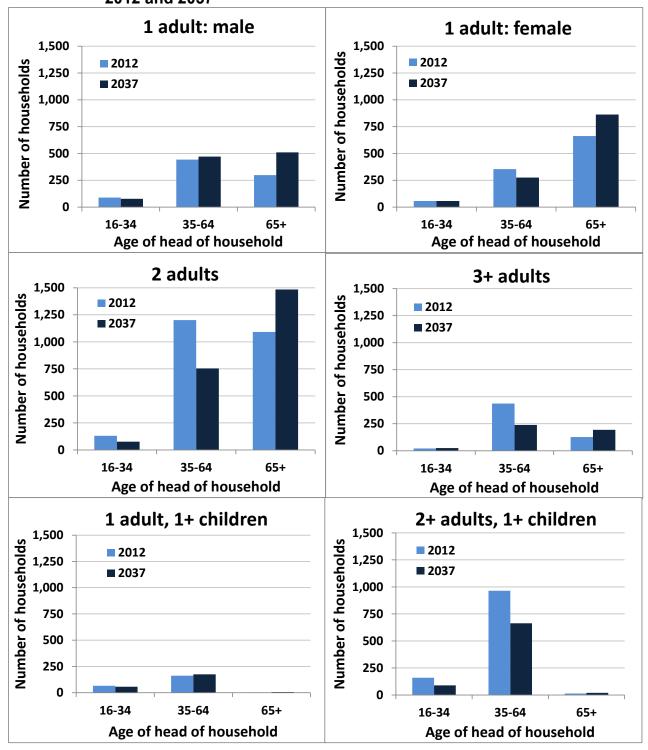

Figure 5b: Projected number of households in Loch Lomond and the Trossachs National Park, by type of household and age of head of household, 2012 and 2037

Overview

2.2.7 In the charts above, it can be seen the most of the household growth, in any household type, is due to growth in older households (aged 65+).

One adult households

2.2.8 In 2012, 18 per cent of the Cairngorms National Park (CNP) population aged 16 or over lived alone and this is projected to rise to 22 per cent by 2037. In Loch Lomond and the Trossachs National Park (LLTNP), the corresponding projected

increase is from 16 to 21 per cent of the population aged 16 or over. Table 5 shows that people are more likely to live alone as they become older. In both National Parks, men are more likely than women to live alone until the age of 65. However for those aged 65 or older, women are more likely to live alone than men. This pattern is influenced by women's greater life expectancy, and their tendency to marry men who are older than them. There is a greater difference between the percentages of older women and men living alone in LLTNP than CNP. In 2037, 35 per cent of women aged 65 or over are projected to live alone in LLTNP and 36 per cent in CNP, compared to 23 and 28 per cent of men, respectively.

2.2.9 The gap between the average life expectancy of men and women in Scotland is narrowing. This means that the number of older men living alone is projected to increase more rapidly than the number of older women. In CNP, the number of men aged 65 or over living alone is projected to increase by 89 per cent, while the number of women in the same age group is projected to increase by 40 per cent, although there are still more older women than men living alone in 2037. In LLTNP, over the same period, the number of men aged 65 and over living alone is projected to increase by 71 per cent, while the number of women in the same age group are projected to increase by just 30 per cent, although again there are still more older women living alone in 2037 than men.

Households containing two or more adults without children

- 2.2.10 For both National Parks, there are large projected increases in the number of households containing two adults, without children, headed by someone in the older age groups (65+), which is likely to be linked to the increase in average life expectancy and the narrowing of the gap between the life expectancy of men and women. The number of two adult households headed by someone aged 65 or over is projected to increase by 53 per cent in CNP, between 2012 and 2037, and 36 per cent in LLTNP. This can be compared to a decrease of 15 per cent in CNP in the younger age groups (under 65), and a decrease of 38 per cent in LLTNP.
- 2.2.11 In contrast to two adult households, the number of households with three or more adults is projected to decline by over a fifth between 2012 and 2037 in both National Parks. This decline is due to large drops in the number of households of this type headed by someone aged 45-64. There were smaller increases in the younger and older age groups.

Households with children

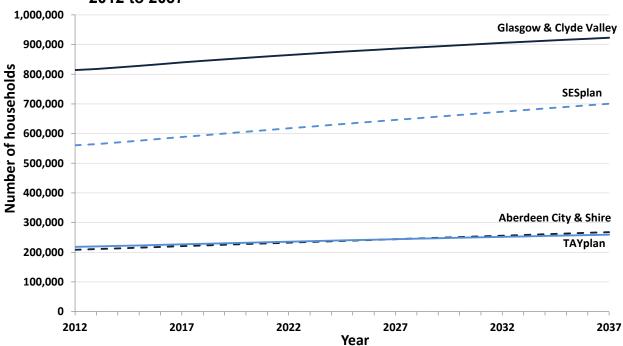

- 2.2.12 Both National Parks are projected to see an increase in the number of one adult households with children between 2012 and 2037, although the increase in LLTNP is small. In CNP, there are increases in one adult households with children headed by someone in all age groups, however the majority of the increase is among those headed by someone aged 35 to 64. In LLTNP, there are reasonably small increases in the number of households of this type that are headed by someone aged 35 or over, but a decrease in the 16 to 34 age group.
- 2.2.13 In contrast, the number of households containing two or more adults with children is projected to fall in both National Parks. In CNP there is an overall decrease of seven per cent, despite the number of households of this type headed by someone aged 65 or over increasing by 192 per cent. Similarly, in LLTNP there is an increase in the number of this type of household that is headed by

- someone aged 65 or over (52 per cent), however decreases in the younger age groups means that there is an overall fall of 32 per cent.
- 2.2.14 In both National Parks there are very few households with children that are headed by someone aged 65 or over.

2.3 Strategic Development Plan (SDP) areas: Overall number of households

- 2.3.1 Figure 6 shows the household projections for each SDP area, from 2012 to 2037. These results can be found in Table 6, along with the corresponding population projections and projections of average household size.
- 2.3.2 The number of households in Scotland is projected to increase from 2.39 million to 2.78 million between 2012 and 2037, an increase of 17 per cent. All SDP areas show projected increases during this period:
 - by 13 per cent in Glasgow & Clyde Valley SDP area, from 814,000 to 922,920 households.
 - by 28 per cent in Aberdeen City & Shire SDP area, from 208,480 to 267,890 households.
 - by 25 per cent in SESplan SDP area, from 560,390 to 700,570 households.
 - by 19 per cent in TAYplan SDP area, from 218,380 to 259,360 households.

Figure 6: Projected number of households in Strategic Development Plan areas, 2012 to 2037

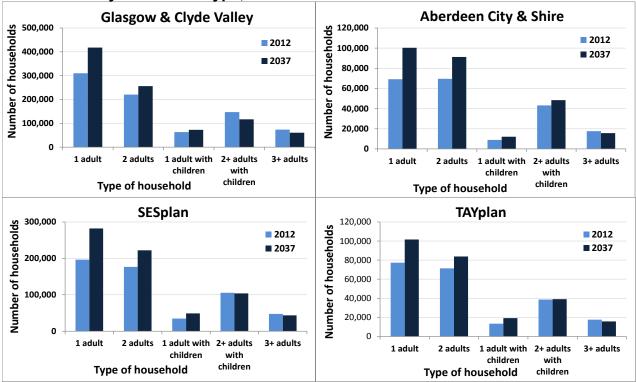

- 2.3.3 The household projections are affected by the projected population trends, however these do not entirely explain the changes in the household projections, as the percentage increases in the household projections are greater than those in the population projections. Between 2012 and 2037 the population is projected to increase by:
 - 4 per cent in Glasgow & Clyde Valley SDP area
 - 23 per cent in Aberdeen City & Shire SDP area
 - 18 per cent in SESplan SDP area
 - 13 per cent in TAYplan SDP area
- 2.3.4 These differences between the household and population projections are due to more people living alone or in smaller households. In all SDP areas the average household size is projected to decrease between 2012 and 2037. The average household size in 2012 in each SDP area is between 2.16 (Glasgow & Clyde Valley and TAYplan) and 2.24 (Aberdeen City & Shire) people, however by 2037 the average household size in each area is between 1.98 (Glasgow & Clyde Valley) and 2.13 (Aberdeen City & Shire) people.

2.4 Strategic Development Plan areas: Type of household and age of head of household

- 2.4.1 Figure 7 shows the projected number of households in 2012 and 2037, by type of household. Tables 7a and 7b show the number and percentage of households in each household type for each SDP area, between 2012 and 2037.
- 2.4.2 The decline in average household size between 2012 and 2037 described above results from more people living alone or in smaller households. There are large projected increases in the number of adults living alone in all SDP areas. These increases range from 32 per cent in TAYplan SDP area to 45 per cent in Aberdeen City & Shire SDP area. These increases are not necessarily the largest percentage increases in each SDP area, but the increases in this group represent the largest number of additional households in each area. There are also projected increases in all SDP areas in the number of households containing two adults and no children, and one adult with children.
- 2.4.3 In contrast, the number of households containing 3 or more adults and no children is projected to decrease in all SDP areas.

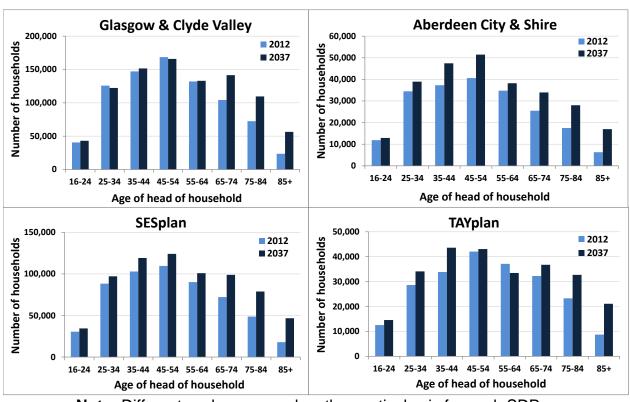

Figure 7: Projected number of households in Strategic Development Plan areas, by household type, 2012 and 2037

Note: Different scales are used on the vertical axis for each SDP area.

2.4.4 Figure 8 shows the projected number of households in 2012 and 2037, by age of head of household. Detailed information on the number and percentage of households, in each SDP area, headed by different ages of head of household, is shown in Tables 8a and 8b.

Figure 8: Projected number of households in Strategic Development Plan areas, by age of head of household, 2012 and 2037

Note: Different scales are used on the vertical axis for each SDP area

- 2.4.5 The ageing population, which results in particularly large projected increases in the population in older age groups, is reflected in the household projections. While there are projected increases in households headed by the majority of age groups in all SDP areas, the increases are particularly large in households headed by older age groups. The projected increases for those households headed by someone aged 65 or over range between 41 per cent in TAYplan SDP area and 62 per cent in SESplan SDP area. By 2037, around a third of the households in each SDP area will be headed by someone aged 65 or over.
- 2.4.6 The projected increase in households headed by someone aged 16-64 varies from just 0.3 per cent in Glasgow & Clyde Valley SDP area, to 9 per cent in TAYplan, 13 per cent in SESplan, and 19 per cent in Aberdeen City & Shire.
- 2.4.7 Projected household numbers for each SDP area, by household type and age of head of household, can be found in Tables 9a to 9d and Figures 9a to 9d.

Figure 9a: Projected number of households in Glasgow & Clyde Valley SDP Area, by type of household and age of head of household, 2012 and 2037

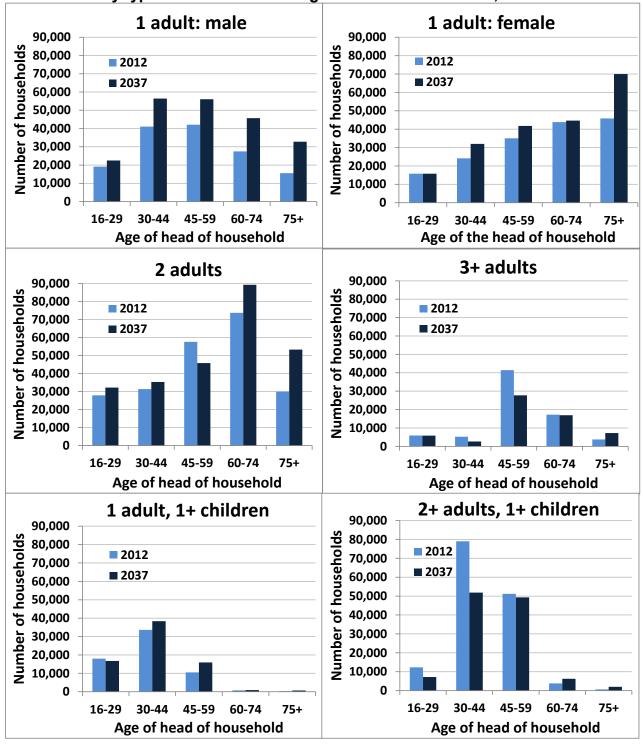

Figure 9b: Projected number of households in Aberdeen City & Shire SDP Area, by type of household and age of head of household, 2012 and 2037

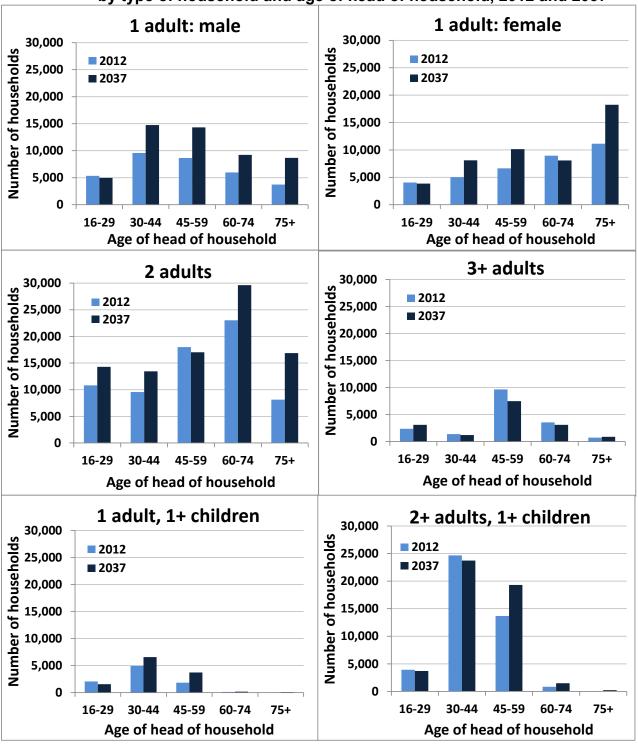

Figure 9c: Projected number of households in SESplan SDP Area, by type of household and age of head of household, 2012 and 2037

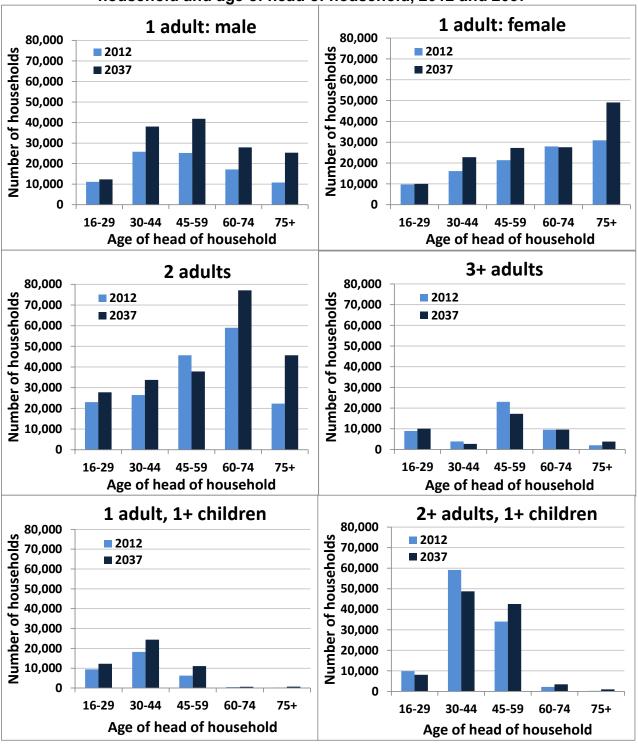

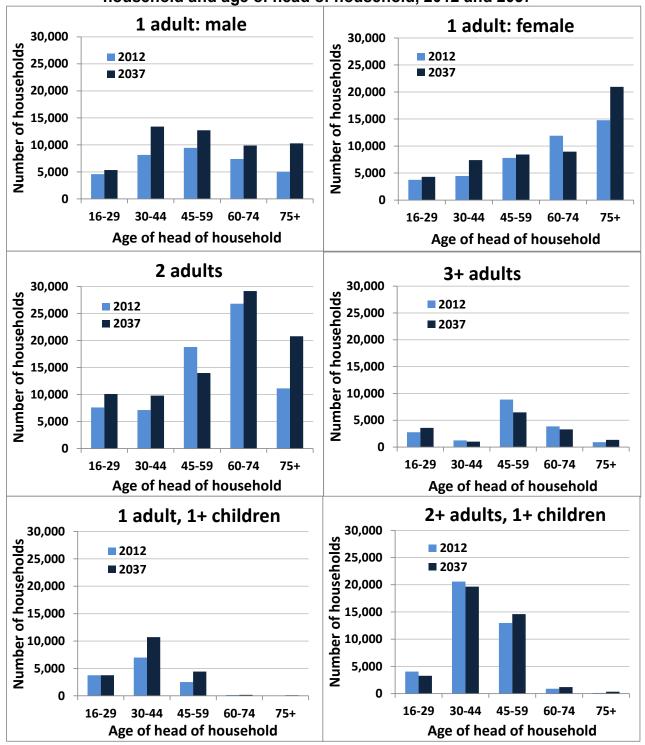

Figure 9d: Projected number of households in TAYplan SDP Area, by type of household and age of head of household, 2012 and 2037

One adult households

- 2.4.8 The projected percentage of people in each area that are living alone can be found in Tables 10a to 10d.
- 2.4.9 Between 2012 and 2037 there are large projected increases in the number of men and women who are living alone, particularly in the older age groups. Over this period, the projected increase in the number of those aged 65 or over living alone is:

- In Glasgow & Clyde Valley SDP area by 53 per cent, from 108,670 to 165,900 households.
- In Aberdeen City & Shire SDP area by 55 per cent, from 24,500 to 38,020 households.
- In SESplan SDP area by 56 per cent, from 71,300 to 111,120 households
- In TAYplan SDP area by 35 per cent, from 32,770 to 44,320 households.
- 2.4.10 In Scotland in 2012, 19 per cent of the population aged 16 or over lived alone, and this is projected to rise to 24 per cent by 2037. This trend is reflected in all SDP areas. In 2012, in most age groups up to their 60s, men are more likely to live alone than women. The exception to this is in the 16 to 19 age group where in all SDP areas a larger percentage of women live alone than men, though the figures are very small for this age group. From the age of 60 onwards, women are more likely to live alone, and the percentage of people living alone increases with age.
- 2.4.11 Between 2012 and 2037, the percentage of people in each age group that live alone is projected to increase in almost all age groups. The exceptions to this are for those in their sixties, seventies and eighties. In these age groups, in most SDP areas there is a decrease in the likelihood that someone lives alone. These decreases are seen more for women than men. Despite this, the total number of men and women living alone are increasing in almost all age groups in each SDP area, as the number of people in each age group increases.
- 2.4.12 The changes described above, between 2012 and 2037, are likely to be a result of increasing average life expectancy of both men and women in Scotland, and of the decreasing gap between the life expectancy of men and women. This means that the number of older men is projected to increase more rapidly than older women. This contributes to the larger projected increases in the number of men living alone, compared to women, but may also contribute to the decreases in the likelihood of people, particularly women in their sixties and seventies, living alone, as their partners are also living longer.

Households containing two or more adults without children

- 2.4.13 For each SDP area, there are large projected increases in the number of households containing two adults without children in the older age groups (65+). This increase is also likely to be linked to the increasing life expectancies and the closing of the gap between male and female life expectancies.
- 2.4.14 The number of two adult households headed by someone aged 65 or over is expected to increase:
 - by 55 per cent in Glasgow & Clyde Valley SDP area, from 76,210 to 117,760 households.
 - by 69 per cent in Aberdeen City & Shire SDP area, from 22,030 to 37,270 households.
 - by 70 per cent in SESplan SDP area, from 58,980 to 100,480 households.

- by 49 per cent in TAYplan SDP area, from 28,050 to 41,840 households.
- 2.4.15 There are also increases in all SDP areas for two adult households that are headed by someone aged under 40, while there are generally decreasing numbers of these households headed by someone aged between their mid-40s and mid-60s.
- 2.4.16 Meanwhile, the number of households with three or more adults is projected to decline between 2012 and 2037 in all SDP areas. The decline does not affect all age groups. In most SDP areas, increases are seen in those households headed by someone under 35, while decreases are seen in those households headed by someone between 35 and 69. Some increases are seen in three person households headed by someone aged 70 or over, in all SDP areas.

Households with children

- 2.4.17 In every SDP area there is a projected increase in the number of households consisting of one adult living with one or more children. These increases range from 15 per cent (Glasgow & Clyde Valley) to 43 per cent (TAYplan). There are increases in the numbers of these households in almost all age groups in SESplan and TAYplan SDP areas. In Aberdeen City & Shire and Glasgow & Clyde Valley SDP areas, there is generally a projected fall in the number of households of this type headed by someone under 35, while there are increases in older age groups.
- 2.4.18 The number of households containing two or more adults and at least one child is projected to increase in Aberdeen City & Shire and TAYplan SDP areas, and projected to decrease in Glasgow & Clyde Valley and SESplan SDP area. Despite these differences, there are similarities in the trends projected for different age groups. In all SDP areas there are projected decreases in nearly every five year age group under 45, with increases in older age groups.

3. Variant Household Projections

3.1 Introduction to the variant household projections

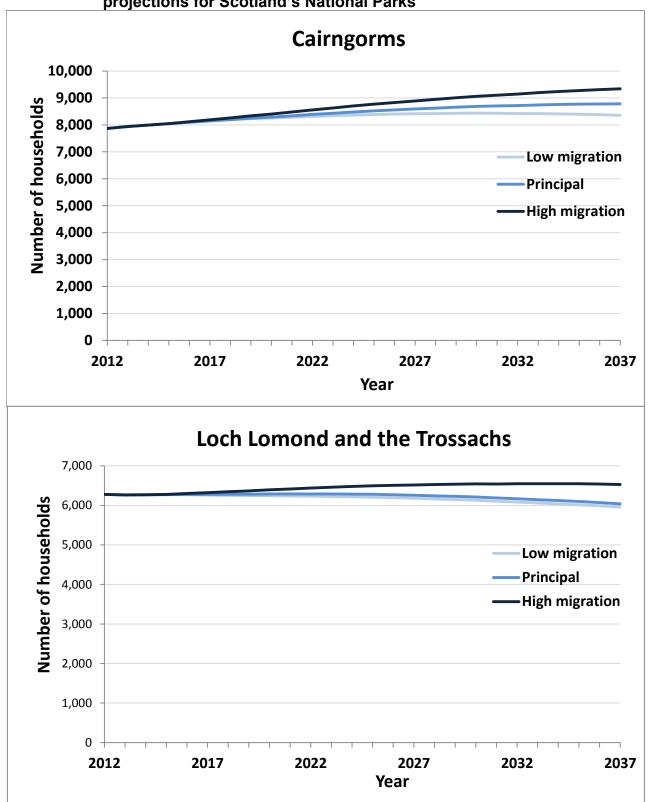

- 3.1.1 Variant projections provide a broad indication of the sensitivity of the household projections to the demographic assumptions that are used to produce them. The principal household projection (described in Section 2) is based on the principal population projection produced by National Records of Scotland (NRS), which uses assumptions about fertility, mortality and migration which are thought most likely to occur over the next 25 years. The household projection is also dependent on the assumption that the projected trends in household formation will continue until 2037.
- 3.1.2 Two variant household projections are presented here. These are based upon variant population projections produced by NRS that use different assumptions regarding future migration. Summary results for the variant projections are presented here. Table 11 shows the total number of households projected for 2037, for each variant, by National Park and Strategic Development Plan (SDP) area. This, and additional comparisons, are discussed below. Full results of each variant projection, for each National Park or SDP area, are available on the NRS website.

3.2 Variation in migration assumptions

- 3.2.1 The low and high migration variant population projections produced by NRS use the same assumptions about fertility and mortality as the principal population projection but assume varied levels of migration to and from Scotland. Further information about the variant population projections can be found in <u>'Population projections for Scotland's Strategic Development Plan Areas and National Parks (2012-based)</u>' on the NRS website.
- 3.2.2 Migration variant household projections are calculated by replacing the principal population projections with the migration variant population projections, keeping all other inputs to the household projections unchanged.
- 3.2.3 Figure 10a shows the household projections for each National Park under the principal, low and high migration variants, from 2012 to 2037.
- 3.2.4 For Cairngorms National Park (CNP), the principal household projection shows the number of households increasing from 7,870 in 2012 to 8,780 in 2037, an increase of 12 per cent. This compares to 8,360 households in 2037 in the low migration projection (a six per cent increase) and 9,340 households in the high migration projection (a 19 per cent increase).

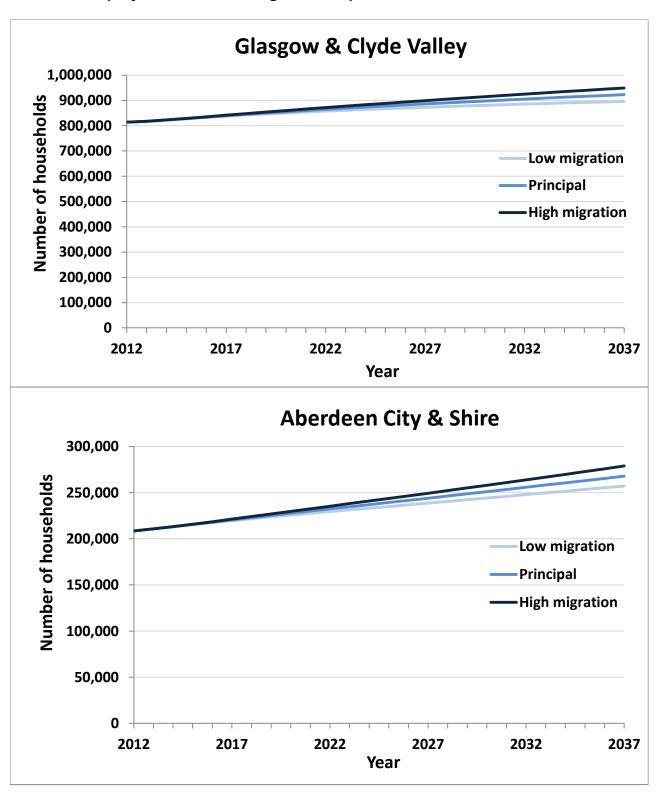

3.2.5 For Loch Lomond and the Trossachs National Park (LLTNP), the principal household projection shows a four per cent fall in the number of households between 2012 and 2037, from 6,280 to 6,040 households. This compares to a decrease of five per cent in the low migration projection (to 5,960 households) between 2012 and 2037. The high migration variant shows an increase of four per cent (to 6,530 households) between 2012 and 2037.

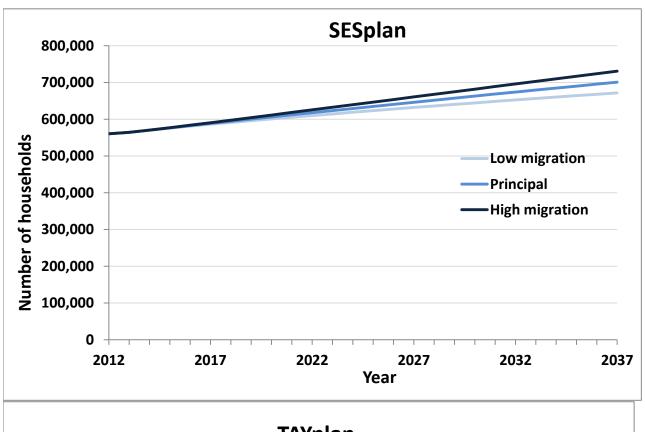

Figure 10a: Principal, low and high migration variants, 2012-based household projections for Scotland's National Parks

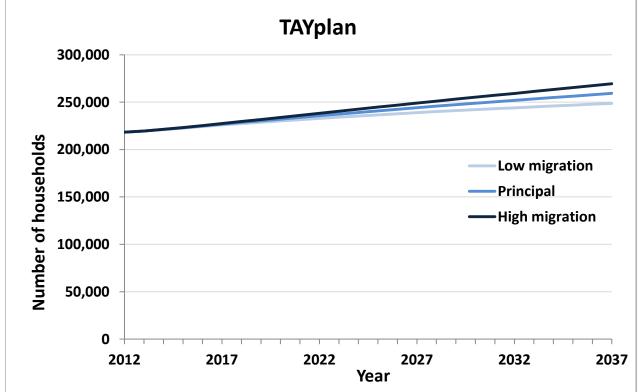

- 3.2.6 Figure 10b shows the household projections for each SDP area under the principal, low and high migration variants from 2012 to 2037.
- 3.2.7 For Glasgow & Clyde Valley SDP area, the principal household projection shows the number of households increasing from 814,000 in 2012 to 922,920 in 2037, an increase of 13 per cent. This compares to 895,820 households in 2037 in the low migration projection (a 10 per cent increase) and 949,320 households in the high migration projection (a 17 per cent increase).
- 3.2.8 For Aberdeen City & Shire SDP area, the principal household projection shows a 28 per cent increase in households between 2012 and 2037, from 208,480 to 267,890 households. This compares to an increase of 23 per cent in the low migration projection (to 257,110 households) and of 34 per cent in the high migration variant (to 278,870 households).
- 3.2.9 For SESplan SDP area, the principal household projection shows the number of households increasing from 560,390 in 2012 to 700,570 in 2037, an increase of 25 per cent. This compares to 671,500 households in 2037 in the low migration projection (a 20 per cent increase) and 730,580 households in the high migration projection (a 30 per cent increase).
- 3.2.10 For TAYplan SDP area, the principal household projection shows a 19 per cent increase in households between 2012 and 2037, from 218,380 to 259,360 households. This compares to an increase of 14 per cent in the low migration projection (to 248,770 households) and of 23 per cent in the high migration variant (to 269,440 households).
- 3.2.11 Out of all the National Parks and SDP areas, the low migration variant had the largest effect in CNP, where the household numbers projected for 2037 were nearly five per cent below the principal projection, and the least effect in LLTNP, where in 2037 the household numbers were only one per cent lower. The high migration variant had the greatest effect in LLTNP, where the household projection for 2037 was eight per cent higher than the principal projections, and least in Glasgow & Clyde Valley SDP area, where the difference was just under three per cent.

Figure 10b: Principal, low and high migration variants, 2012-based household projections for Strategic Development Plan areas

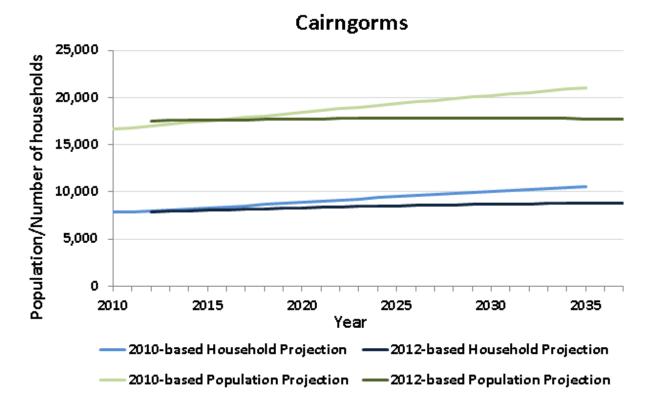

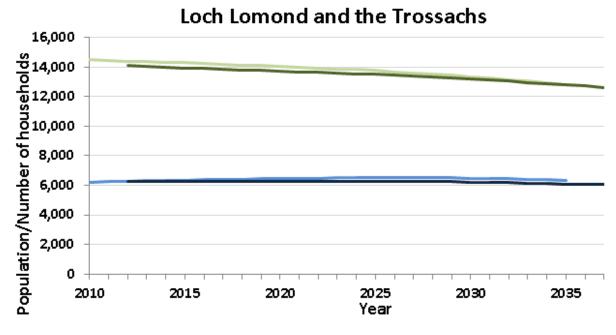

- 4. Comparison with previous household projections for Scotland's Strategic Development Plan (SDP) Areas and National Parks
 - 4.1.1 Household projections for Scotland's SDP areas and National Parks are published every two years, and cover a 25 year period. Figure 11 compares the 2012-based household projection with the 2010-based household projection for the National Parks. It also shows the 2010-based and 2012-based population projections for each area (which are incorporated into the household projections). The methodology for the 2012-based household projections has been reviewed, so they now incorporate data from three censuses instead of two, and they incorporate survey data to reflect more recent trends.
 - 4.1.2 For both national parks, the 2012-based household projection is lower than the 2010-based projection throughout.
 - 4.1.3 In Cairngorms National Park, the number of households is projected to increase by 12 per cent in the 2012-based projection, compared to an increase of 35 per cent in the 2010-based projection. The main factor for this is the differences between the population projections used as an input in the household projections. In the 2012-based population projection there was a projected increase of just one per cent, while in the 2010-based projection the population was projected to increase by 26 per cent.
 - 4.1.4 In Loch Lomond and the Trossachs National Park there is a smaller difference between the two sets of household projections. For this area, the 2012-based household projections have a lower rate of growth than the 2010-based household projection. This is despite there being a smaller projected fall in the population projections. This means that the lower projected growth in household numbers is due to the inclusion of headship data from the 2011 Census, affecting the types of households that people are projected to live in.

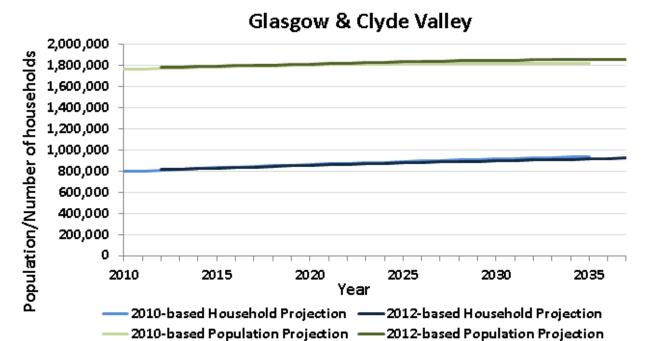

Figure 11: Comparing 2010 and 2012-based population and household projections for Scotland's National Parks

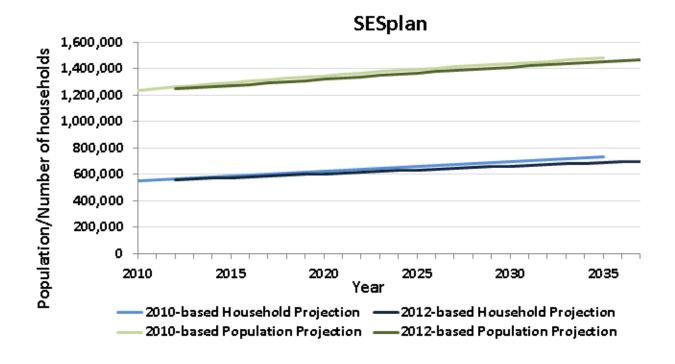

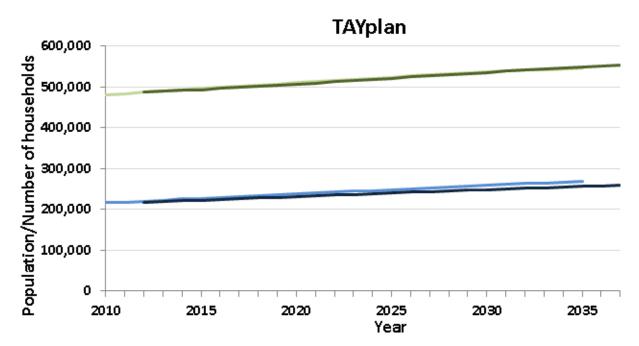

- 4.1.5 Figure 12 compares the 2012-based household projection with the 2010-based projection for Scotland's Strategic Development Plan areas.
- 4.1.6 For every year after 2013, the 2012-based household projection is lower than the 2010-based projection for all four Strategic Development Plan areas, and the rate of projected growth is also lower.
- 4.1.7 In SESplan and TAYplan SDP areas, the population is also projected to grow less quickly in the 2012-based population projections than in the 2010-based-projections. This partially explains the differences between the 2010 and 2012-based household projections. However, the introduction of headship rates from the 2011 Census is also a factor.
- 4.1.8 In Aberdeen City and Shire SDP area, the two sets of population projections both show an increase of 23 per cent. This means that the lower rate of growth in the number of households in the 2012-based projection, compared to the 2010-based projection, is largely due to people being projected to live in different household types due to the introduction of 2011 Census data in the 2012-based household projections.
- 4.1.9 Similarly, in Glasgow and Clyde Valley SDP area, the main factor for the 2012-based household projections having a smaller increase in households than the 2010-based projection is the introduction of 2011 Census data. In fact, the population of Glasgow and Clyde Valley is projected to grow more quickly in the 2012-based projection than in the 2010-based projection.

Figure 12: Comparing 2010 and 2012-based population and household projections for Scotland's Strategic Development Plan areas

5. Sources and Methods

5.1 Summary

- 5.1.1 This is the first set of household projections to be produced since results from the 2011 Census became available. We have reviewed the method used to produce the projections, to decide how best to incorporate the new census data. This review has led to significant changes in the way that information on the types of households that people live in is projected forward. These changes mean longer-term trends have been incorporated, and the method now has the flexibility to make adjustments to the census-based trends in household formation based on more up-to-date survey information. This becomes increasingly important as the base year of the projection moves further away from the most recent census. A brief description of the method is given below, and more detailed information is provided in the following sections.
- 5.1.2 The household projections are based on population projections produced by the National Records of Scotland (NRS). The number of people living in private households is estimated by taking the population projections for each year and subtracting the number of people living in communal establishments, such as student halls of residence, care homes or prisons. To estimate the number of households of each type, information on household formation is projected forward from the 1991, 2001 and 2011 Censuses, for each household type, age group and Council area. This information is then applied to the private household population to produce the basic household projections.
- 5.1.3 The overall household projections for Scotland are believed to be more accurate than those for smaller geographies, therefore the projections for other geographies are constrained to the Scottish total. Each year NRS produces estimates of the total number of households in each Council area, based on Council Tax data. These estimates are based on more recent data than the household projections therefore the household projections for 2012 and 2013 are adjusted to match the household estimates for these years, and the household projections for 2014 onwards are adjusted by the same proportions as 2013. For other geographies, such as National Parks, occupied dwelling counts, summed from data zone level information, are used instead of household estimates.

5.2 Household types and age groups used in the household projections

5.2.1 Household projections are produced for each Strategic Development Plan (SDP) area, broken down into seven household types, based on the number of adults and children living in the household, and sixteen age groups (Table A). These are the same types and age groups used for the Council area projection.

Table A: Household types and age groups used in the Strategic Development Plan area household projections

Household types									
1 person households:									
1 adult: male 1 adult: female									
2 person households:									
2 adults 1 adult, 1 child									
3+ person households:									
1 adult, 2+ children 2+ adults, 1+ childrer 3+ adults	1								

Age group
16-19
20-24
25-29
30-34
35-39
40-44
45-49
50-54
55-59
60-64
65-69
70-74
75-79
80-84
85-89
90+

5.2.2 The household projections are produced for each National Park area, broken down into six household types and three age groups (Table B). Due to the small numbers of people in each group in each National Park it is not appropriate to produce projections for smaller age groups.

Table B: Household types and age groups used in the National Park household projections

Household types									
1 person households:									
1 adult: male 1 adult: female									
2+ person households:									
2 adults 1 adult, 1+ children 2+ adults, 1+ children 3+ adults									

Age group
16-34
35-64
65+

5.3 Data sources

- 5.3.1 Five sets of data are used as inputs to the household projections:
 - 2012-based population projections for Scotland's Strategic Development Plan Areas and National Parks
 - estimates of the proportions of the population that are resident in communal establishments in 2012
 - headship rates from the 1991, 2001 and 2011 Censuses
 - estimates of the distribution of households across the seven household types in 2012 from Scottish Household Survey data
 - 2012 and 2013 household estimates.

These are described in more detail below.

Population projections

5.3.2 The first input into the household projections is the 2012-based population projections. These are produced for Scotland by area, sex and single year of age, using assumptions about births, deaths and migration. More information about the population projections, and the assumptions used to produce them, can be found in 'Population Projections for Scotland's Strategic Development Plan Areas and National Parks (2012-based)' on the NRS website. The relevant population for household formation is taken to be the adult population, aged 16 or over. The low and high migration variant population projections used in the variant household projections are taken from the same publication.

Communal Establishment Estimates

- 5.3.3 Estimates of the proportion of the population living in communal establishments, such as care homes or prisons, are used to derive the number of people living in private households from the total population given in the population projections. These proportions are calculated, by age group and sex, from the mid-2012 population estimates published by NRS and numbers of residents in communal establishments, as collated by NRS.
- 5.3.4 Numbers of residents in communal establishments are collected from a range of data sources, depending on the establishment type. The data is chosen to represent, as closely as possible, the census definition of residence, that is those individuals "staying, or expecting to stay, in a residential establishment for six months or more". Individuals resident for shorter stays would be considered visitors and are not included, as they should be accounted for in their usual place of residence.
- 5.3.5 Data is collected from a range of administrative data sources and surveys and refers to 2012, where possible. For some establishment types, however, no such source is available, and in these cases 2011 Census data is used.

 Table C details the sources of communal establishment data and the year to which the data refers. In many cases, more than one data source was combined and estimation was required to obtain a full age/gender breakdown for all establishments.

Table C: Communal establishment data sources

Establishment type	Data source	Year of data
Adult care ¹	Care Inspectorate (List of registered establishments)	2012
	ISD ² Care Home Census	2012
Children's care ¹	Care Inspectorate (List of registered establishments)	2012
	SG Looked After Children Statistics	2012

Higher Education ¹	HESA ⁴	2011/12
Other	2011 Census	2011

Headship rates

- 5.3.6 The household formation information used in the household projections is in the form of headship rates, derived from the 1991, 2001 and 2011 Censuses. These rates are used to convert the private household population into household numbers.
- 5.3.7 In the census, one member of each household is designated the 'head of household' (usually the first adult recorded on the household form). The headship rate describes, for each age group, the proportion of the population that is designated the head of household for each household type. The proportion of the population, for each age group, who are not a head of any type of household (non-heads) is also available from the census. The proportions for each household type, including non-heads, sum to one, within each age group and area. The number of people who head particular household types is the same as the number of households of this type.
- 5.3.8 There is a minor difference in how the headship rates were calculated from each census. As data zones are built up from 2001 output areas, headship data from the 2001 Census was produced for exact-fit data zones. This was not possible for the 1991 and 2011 Census data, where instead data is based on 1991 and 2011 Census output areas respectively, to produce best-fit data zones. This means that the boundaries used for the headship data from each census differ slightly. However, the effect that this has on the headship rates is

¹⁾ For this establishment type, data from two or more sources are combined to estimate the age/gender breakdown of residents in each area, as no comprehensive source was available.

²⁾ ISD - Information Services Division of NHS Scotland

³⁾ DASA - Defence Analytical Services and Advice

⁴⁾ HESA - Higher Education Statistics Agency

⁵⁾ Further information on the communal establishment data collection and the uses of this data can be found in the methodology section of the 2012-based household projections for Scotland.

slight as the differences between the exact-fit data zones and best-fit zones is small.

Household type distribution

5.3.9 For the first time, survey data has been included in the projection method and plays an important role in the projection of headship rates. The data comes from the 2012 Scottish Household Survey (SHS) and consists of an estimate of the proportion of households of each type. This data is then adjusted based on differences between 2011 SHS data and the 2011 Census to take into account higher levels of non-response from particular household types in the SHS.

Household estimates

5.3.10 Household estimates are published annually by NRS and the household projections use the estimates from the latest two years (2012 and 2013). The estimates are based on Council Tax data, and provide the total number of households for each Council area in Scotland. The latest household estimates can be found in the 'Estimates of Households and Dwellings in Scotland' publication on the NRS website. For other geographies, such as National Parks and SDP areas, occupied dwelling counts, summed from data zone level information, are used instead of household estimates.

5.4 Methodology

- 5.4.1 There are several stages to the calculation of the household projections. The first stage calculates the private household population. This is done by first estimating the number of communal establishment residents in each year of the projection, by applying the communal establishment rates described above to the population projections. The communal establishment residents are then subtracted from the population projections to give the private household population for each projection year.
- 5.4.2 The second stage in calculating the household projections is to estimate the number of households from the private household population, using the headship rates described above. Two sets of projected headship rates are produced using a modified two-point exponential model, one using headship rates from the 1991 and 2001 Censuses, and the other using headship rates from the 2001 and 2011 Censuses. The formula for the modified two-point exponential model is as follows:

$$y_i = k + ab^{x_i}$$
 where
$$i = \text{the year, from 2012 to 2037}$$

$$y_i = \text{the headship rate in year i}$$

$$k = 1 \text{ if } y_c \ge y_d$$

$$0 \text{ if } y_c < y_d$$

$$a = y_d - k$$

$$b = (y_c - k)/(y_d - k)$$

$$x_i = (i - d)/(c - d)$$

- c = the most recent census year (2001 or 2011)
- d = the furthest away census year (1991 or 2001)
- 5.4.4 The two sets of projected headship rates are then combined into a final set of headship rates using weights and the following formula:

$$y_i = \frac{A^{(1)} * y_i^{(1)} + A^{(2)} * y_i^{(2)}}{A^{(1)} + A^{(2)}}$$

where i = the year, from 2012 to 2037

y_i = final headship rate in year i

A⁽¹⁾ = weight given to rates projected using 1991 and 2001 data

A⁽²⁾ = weight given to rates projected using 2001 and 2011 data

y_i⁽¹⁾ = projected headship rate in year i using 1991 and 2001 data

y_i⁽²⁾ = projected headship rate in year i using 2001 and 2011 data

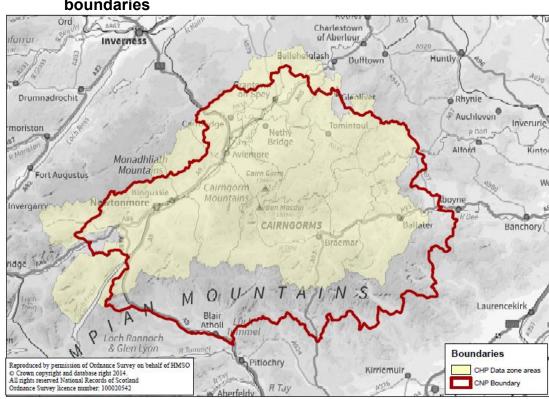

- 5.4.5 The weights are chosen so that the projection for 2012 has a distribution of households across the seven household types that is as close as possible to the distribution found in the adjusted 2012 Scottish Household Survey data. This allows us to incorporate more recent information on the types of households that people are living in, rather than purely relying on census data. For the 2012-based projections, the weights used were 75 per cent towards the headship rates using 2001 and 2011 Census data and 25 per cent towards projected headship rates using 1991 and 2001 Census data.
- 5.4.6 The projected headship (and non-headship) rates are constrained so that:
 - they cannot individually go above one or below zero; and
 - they sum to one within an area and age group.
- 5.4.7 The household projections are calculated by applying the projected headship rates to the private household population projections to give an estimate of the number of heads of household in each of the projection years for each household type, age group of the head of household and area.
- 5.4.8 The final stages of the household projection methodology apply a series of adjustments to the household projections. The first adjustment is to control the National Park projections, including a projection of the 'Rest of Scotland', to the all-Scotland projection, as the latter is thought to be more accurate. For SDP areas, the adjustment is different. Where a whole Council area (CA) is projected, the projections for all Council areas are controlled to the all-Scotland projections. In contrast, where sub-CA areas are projected, projections are produced for the area that is within the SDP area and the area that is not, and these sub-CA projections are controlled to the main CA projection.
- 5.4.9 The next adjustment is for the total number of households within each area in 2012 and 2013 to be controlled so that it is equal to the household estimates for these years. The household projections for 2014 onwards are then adjusted by the same proportions as the 2013 year, to preserve the trend in the household

- projections. This adjustment allows us to incorporate more recent information on household numbers than the 2011 Census into the household projections.
- 5.4.10 The final adjustment ensures that the minimum number of adults required to fill the projected households is not greater than the projected adult private household population (e.g. a minimum of two adults would live in a 'two or more adult' household). The same check is carried out for children. Where an adjustment is required, the number of households is kept constant, but the balance of household types is adjusted, to reduce the number of large households and increase the number of smaller households.
- 5.4.11 For the 2012-based household projections, no minimum adult or child adjustments were required in either of Scotland's National Parks, or any of the SDP areas.

5.5 National Park and Strategic Development Plan (SDP) Boundaries

- 5.5.1 The populations of the National Park and SDP areas were built up from the National records of Scotland (NRS) mid-2012 Council area and data zone populations. Data zones are the standard small area geography used by the Scottish Government. In general they have populations of between 500 and 1,000 residents. Data zone boundaries do not exactly match National Park and SDP boundaries and so, for the purpose of the projections, data zones are included or excluded based on the data zone centroid, as determined by the Scottish Government. Data zones that have been used to calculate household projections for National Park and SDP areas are listed in Annex A and Annex B.
- 5.5.2 The use of data zone centroids is a standard approach for assigning the population of a small geographical area to a larger area if the small area does not wholly fit within the boundaries of the larger area or lies across the border of two larger areas. The centroid is not a representation of the geographical centre of the data zone, but rather a representation of the population weighted centre or, put more simply, the population 'centre of gravity' of the area. In this publication, a data zone is allocated to the National Park or SDP area if the population weighted centroid lies within the boundary.
- 5.5.3 A paper describing the methodology for calculating data zone centroids can be found at the <u>Scottish Neighbourhood Statistics</u> section of the Scottish Government website.
- 5.5.4 The boundaries of the National Park areas, and the relevant data zones, are shown in Map 3 and Map 4. Though the actual park boundaries do not precisely match those used in this publication, the difference between the two is very small in terms of population.

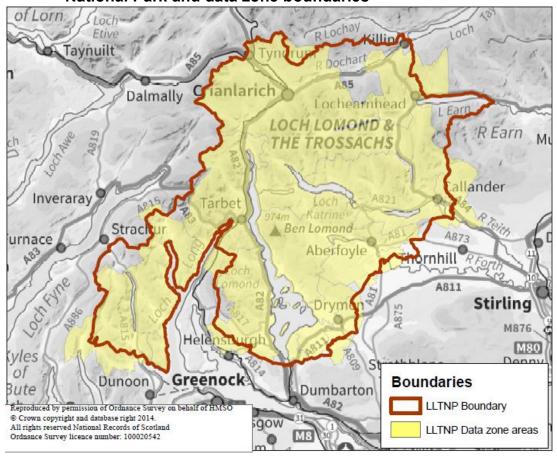

5.5.5 (Data zone populations have been estimated to be 1.89% less for the Cairngorms National Park and 3.77% less for Loch Lomond and the Trossachs National Park when compared to postcode populations in 2001²). The Cairngorms National Park (CNP) boundary does not coincide with the data zone boundary around Boultenstone and Dinnet to the east of the park, Glen Clova to the south west, Glenlivet to the north east, and the area east of Loch Laggan. For Loch Lomond and the Trossachs National Park (LLTNP), mis-match occurs near Balloch, Killin, the eastern shores of Loch Earn and the area around Glenbranter.

Map 3: Cairngorms National Park comparing National Park and data zone boundaries

²⁾ A report on the comparison of populations of non-standard geographies constructed from different small area geographies was produced in 2008. The report includes a comparison of different population estimates for National Parks based on postcode and data zone geographies using 2001 Census populations. The report can be found on the <u>Populations of Non-Standard Geographies</u> page of the Scottish Government website.

Map 4: Loch Lomond and the Trossachs National Park comparing National Park and data zone boundaries

- 5.5.6 Strategic Development Pan (SDP) areas cover the regions around Aberdeen, Dundee, Edinburgh and Glasgow. SDP areas are made up of a combination of some entire Council areas, and some Council area parts. Where entire Council areas are included, their projections are from the Council area household and population projections which have already been published. These are combined with new projections for the sub-Council areas described at Annex B to obtain projections for the overall SDP area. The SDP areas comprise:
 - Aberdeen City and Shire Strategic Development Plan Areas (Aberdeen City and Shire SDP area): Aberdeen City and Aberdeenshire Council areas (except the part of Aberdeenshire that forms part of CNP).
 - Glasgow and the Clyde Valley Strategic Development Plan area (Glasgow & Clyde Valley SDP area): East Dunbartonshire, East Renfrewshire, Glasgow City, Inverclyde, North Lanarkshire, Renfrewshire, South Lanarkshire and West Dunbartonshire Council areas (except the part of West Dunbartonshire that forms part of LLTNP).
 - Edinburgh and South East Scotland Strategic Development Plan area (SESplan area): City of Edinburgh, East Lothian, Midlothian, Scottish Borders, West Lothian and Fife (Kirkcaldy, Mid-Fife and Dunfermline local planning areas only) Council areas.

 Dundee, Perth, Angus and North Fife Strategic Development Plan area (TAYplan area): Angus (except the part of Angus that forms part of CNP), Dundee City, Perth & Kinross (except the part of Perth & Kinross that forms part of LLTNP) and Fife (St. Andrews and North Fife local planning areas only) Council areas.

6. Definitions and limitations of the household projections

6.1 Definitions

- 6.1.1 The following definitions are used in this publication:
 - Household: the 2011 Census definition of a household is used one person living alone or a group of people (not necessarily related) living at the same address who share cooking facilities and share a living room or sitting room or dining area. This excludes people living in communal establishments.
 - **Private household population**: The population living in private households, i.e. people not living in a communal establishment.
 - **Communal establishment**: An establishment providing managed residential accommodation, such as a hospital, care home, prison, student hall of residence or barracks. 'Managed' means full-time or part-time supervision of the accommodation.
 - **Head of household**: The 'head' of the household is normally the first person entered on the census form. The number of heads of household will be equal to the number of households.
 - **Headship rate**: The proportion of people who head particular household types within any particular age group and area is known as the 'headship' rate.
 - Children: Where children are included in a household type, the 2011 Census definition of a dependent child is used. A dependent child is anyone aged 0 to 15 in a household (whether or not in a family) or a person aged 16 to 18 in full-time education and living with his or her parent(s) or grandparent(s). It does not include any people aged 16 to 18 who have a spouse, partner or a child living in the household.
 - Average household size: The average number of people in private households, calculated by dividing the private household population by the number of households.

Figures in the tables are rounded to the nearest whole number. Therefore, the totals shown may not be equal to the sum of all the constituent parts. Calculations of additional figures based on the data in a table, for example percentage change between two years' household numbers, have been done using unrounded numbers and then rounded accordingly.

6.2 Limitations

6.2.1 These household projections have limitations. A projection is a calculation showing what happens if particular assumptions are made. The household projections are trend-based and are not, therefore, policy-based forecasts of what the Government expects to happen. They are based on the population

- projections and, as a result, assumptions used for the population projections, such as future migration, fertility and mortality, will affect the household projections. These assumptions are based on past trends. Since smaller areas tend to be affected more by migration, which is harder to predict, projections for these areas tend to be less reliable than those for areas with larger populations.
- 6.2.2 The household projections also rely on projecting trends in household formation from the 1991, 2001 and 2011 Censuses to 2037. They show what's likely to happen if these trends continue into the future. There are various reasons why patterns of household formation may be different in the future, such as economic changes or the impact of new government policies, as well as imbalances between housing supply and demand. Assuming the continuation of past trends results in uncertainty in the projections, and this uncertainty increases the further into the future they are taken. Local planning policies are often intended to modify past trends, and Development Plans may demonstrate departures from the projections that seem better able to fit particular local circumstances.
- 6.2.3 If the projections relied solely on projecting household formation trends from Census data they would be unable to reflect any changes in household formation following the 2011 Census. They would become increasingly unreliable as the start year moved further from 2011. However, the new method used for the 2012-based household projections means that any changes in household formation since the 2011 Census will be incorporated through the use of recent survey data. This will become increasingly important for future sets of projections. The 2012-based projections start roughly a year after the Census and use survey data from 2012 so they should reflect recent trends in household formation relatively well. The use of information from three censuses should also mean that longer term trends are included.
- 6.2.4 Projections for small groups are likely to be less reliable than those for larger groups as they are based on data from smaller numbers of people (or households).

Relationship to other projections

6.2.5 These projections apply a single methodology across all areas. Individual areas may have a wider range of local information, based for example on local population or household surveys, on which to compile local projections. The supporting material on the NRS website should assist in providing an understanding of the basis of our projections. We are happy to provide additional supporting or background material which users would find useful in assessing and using the projections, where possible. Please contact us at customer@gro-scotland.gsi.gov.uk.

7. Related publications

7.1 National Records of Scotland (NRS) publications (available on the NRS website)

- 7.1.1 The main <u>household projections</u> show figures for Scotland and for each Council area.
- 7.1.2 The NRS <u>household estimates</u> show annual estimates of the number of households and dwellings in Scotland.
- 7.1.3 The NRS population <u>estimates</u> and <u>projections</u> show annual estimates of the number of people in Scotland, and projections for future populations. <u>Population Projections for SDP areas and National Parks</u> are also available.
- 7.1.4 You can register with the Scottish Government's <u>ScotStat website</u> to receive notification of forthcoming NRS household estimates and projections publications, as well as a range of other statistics on Scotland.

7.2 Scottish Government Statistics

7.2.1 The Scottish Government publish on their website <u>Housing Statistics for Scotland</u> and statistics on <u>vacant and derelict land</u>.

7.3 Household estimates and projections for other parts of the UK

- 7.3.1 Household estimates and projections for other parts of the UK are available from the following sources and websites.
 - England: <u>Department for Communities and Local Government</u> (gov.uk website)
 - Wales: Welsh Government (wales.gov.uk website)
 - Northern Ireland: <u>Northern Ireland Statistics and Research Agency</u> (nisra website)

There are many similarities between the projections, but also some subtle differences between methods. A joint report containing a broad comparison of the household projection methodologies across the UK can be found on the Welsh Government website. The report was published in 2011, therefore it doesn't include the changes we've made to our method or any changes that may have been made by other parts of the UK. However it provides a useful starting point in understanding the methods used by each country.

The latest household projections for England are interim 2011-based projections, which don't fully incorporate the results of the 2011 Census as certain information wasn't available when they were produced. Therefore they only cover the ten years from 2011 to 2021. Changes were made to the calculation method to use estimation where 2011 Census data was unavailable.

The latest set of household projections for Wales are 2011-based projections. Unlike England's, these fully incorporate the results of the 2011 Census and cover the 25 year period from 2011 to 2036. Information on household formation is taken from the 2001 and 2011 Censuses only (i.e., the 1991 Census isn't used). Detailed information on the method used has yet to be published.

The latest set of household projections for Northern Ireland are 2008-based. NISRA plans to publish 2012-based projections in November/December 2014.

¹⁾ This is the 2012-based principal population projection, published on the NRS w ebsite.

²⁾ The average household size is calculated by dividing the private household population by the total number of households for each year.

³⁾ Average annual change is the result of dividing the absolute change (before rounding) by the number of years of the projection Household figures are rounded to the nearest whole number.

Footnotes

1) Average annual change is the result of dividing the absolute change (before rounding) by the number of years of the projection.

Household figures are rounded to the nearest whole number.

Table 9c: Household projections for SESplan SDP area, by household type and age of head of household, 2012 to 2037

	type a.						- ,	.

1) Average annual change is the result of dividing the absolute change (before rounding) by the number of years of the projection. Household figures are rounded to the nearest whole number.

Table 9d: Household projections for TAYplan SDP area, by household type and age of head of household, 2012 to 2037

Footnotes

These figures are equal to the number of people in the age group projected to live in a 'one adult' household, divided by the projected population of that age and gender (including those living in communal establishments).

Annex B: Details of the data zones that have been used to calculate the household projections for Strategic Development Plan areas

In Section 5.5, there is a description of Strategic Development Plan (SDP) boundaries. In essence SDP areas are aggregates of Council areas, excluding the areas of the National Parks. There are several data zones in Aberdeenshire and West Dunbartonshire that overlap the two National Parks. These data zones are excluded from the SDP areas. Fife is split into two parts with the north part of Fife included in TAYplan SDP area and the south part included in SESplan SDP area.

Details of these data zones are given here:

Data zones in Aberdeenshire that are also in Cairngorms National Park, and so are excluded from the projections for the Aberdeen City & Shire SDP area

S01000301 S01000303 S01000312 S01000316

S01000360

Data zones in West Dunbartonshire that are also in Loch Lomond and the Trossachs National Park, and so are excluded from the projections for the Glasgow & Clyde Valley SDP area

S01006292 S01006293 S01006294

Data zones in Fife that are part of TAYplan SDP area for the purpose of the projections

8. Notes on statistical publications

National Statistics

The United Kingdom Statistics Authority has designated these statistics as National Statistics, in line with the Statistics and Registration Service Act 2007 and signifying compliance with the Code of Practice for Official Statistics (available on the UK Statistics Authority website).

Designation can be broadly interpreted to mean that the statistics:

- meet identified user needs:
- are well explained and readily accessible;
- are produced according to sound methods; and
- are managed impartially and objectively in the public interest.

Once statistics have been designated as National Statistics it is a statutory requirement that the Code of Practice shall continue to be observed.

National Records of Scotland

We, the National Records of Scotland, are a non-ministerial department of the devolved Scottish Administration. Our aim is to provide relevant and reliable information, analysis and advice that meets the needs of government, business and the people of Scotland. We do this as follows:

- Preserving the past We look after Scotland's national archives so that they are available for current and future generations, and we make available important information for family history.
- Recording the present At our network of local offices, we register births, marriages, civil partnerships, deaths, divorces and adoptions in Scotland.
- Informing the future We are responsible for the Census of Population in Scotland which we use, with other sources of information, to produce statistics on the population and households.

You can get other detailed statistics that we have produced from the <u>Statistics</u> section of our website. Statistics from the 2001 Census are on <u>Scotland's Census Results On-Line (SCROL)</u> website and the 2011 Census results are held on the <u>Scotland's Census</u> website.

We also provide information about <u>future publications</u> on our website. If you would like us to tell you about future statistical publications, you can register your interest on the Scottish Government <u>ScotStat website</u>.

Please note:

National Records of Scotland is now on twitter @NatRecordsScot

Enquiries and suggestions

Please contact our Statistics Customer Services if you need any further information.
