Main Points

- Men in rural areas – remote and accessible – can expect to live over 3 years longer (77.2 and 77.0 years respectively) than men in large urban areas (73.5 years);
- Women in rural areas – remote and accessible – can expect to live almost 2 years longer (81.0 and 80.9 years respectively) than women in large urban areas (79.1 years);
- Life expectancy decreases as deprivation increases;
- Men in the 10 per cent **least** deprived areas of Scotland can expect to live for 13.4 years more than men in the 10 per cent **most** deprived areas (80.7 years compared with 67.3 years);
- Women in the 10 per cent **least** deprived areas of Scotland can expect to live 8.8 years longer than those in the 10 per cent **most** deprived areas (83.8 years compared with 75.0 years);
- Men in East Dunbartonshire Community Health Partnership area can expect to live over 8 years longer than men in East and North Glasgow Community Health and Care Partnership areas (78.0 years compared to 69.3 and 69.7 years respectively);
- Women in Shetland Community Health Partnership area can expect to live over 6 years longer than women in North and East Glasgow Community Health and Care Partnership areas (82.6 years compared to 76.2 and 76.5 years respectively);

1. Introduction

This publication summarises the Registrar General for Scotland's life expectancy figures for the following "special areas" within Scotland:

- **Urban and Rural Areas**

The urban-rural split used in this publication is based on the Scottish Government's 6-fold Urban Rural Classification version 2007-2008. The differences between the 2005-2006 and the 2007-2008 classifications stem from changes to either settlement populations or settlement boundaries. The definitions of urban and rural areas underlying the classification are unchanged. For more information visit [Scottish Government Urban Rural Classification 2007-2008](#).

The 6-fold classification distinguishes between urban, rural and remote areas within Scotland. It is consistent with the Government's definition of rurality and includes the following categories:

1 Large Urban	Settlements of over 125,000 people.
2 Other Urban	Settlements of 10,000 to 125,000 people.
3 Accessible Small Towns	Settlements of between 3,000 and 10,000 people and within 30 minutes drive of a settlement of 10,000 or more.
4 Remote Small Towns	Settlements of between 3,000 and 10,000 people and with a drive time of over 30 minutes to a settlement of 10,000 or more.
5 Accessible Rural	Settlements of less than 3,000 people and within 30 minutes drive of a settlement of 10,000 or more.
6 Remote Rural	Settlements of less than 3,000 people and with a drive time of over 30 minutes to a settlement of 10,000 or more.

- **Deprivation areas**

Deprivation areas are based on the [Scottish Index of Multiple Deprivation \(SIMD\) 2006](#) developed by the Scottish Government. The SIMD ranks the 6,505 Scottish data zones (areas of compact shape and similar social characteristics, with populations of between 500 and 1,000 people) from 1 (most deprived) to 6,505 (least deprived). The SIMD rank can be split into vigintiles, deciles and quintiles. Life expectancy figures for deprivation areas have been presented in this way.

- **Community Health Partnerships**

Community Health Partnerships (CHPs) are organisations responsible for managing community health services in Scotland. CHPs develop existing links between community and hospital-based health services and local authority services such as social work, housing, leisure and education. Their principal aim is to improve the long-term health and wellbeing of communities and enhance the quality of health and social care services. In some areas, such as Glasgow, the Partnerships are responsible for many local social care services and are therefore called Community Health and Care Partnerships (CHCPs) or Community Health and Social Care Partnerships (CHSCPs) and are run jointly by the NHS with local Council partners.

The Scotland-level life expectancy estimate shown in this publication is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics: [National Statistics Online - Interim Life tables](#).

Life expectancy statistics for each Council and NHS Board area were given in [Life Expectancy for Administrative Areas within Scotland, 2005-2007](#) published by GROS on 25 September 2009. Section 4 of that publication provides further information on national and sub-national life expectancy and healthy life expectancy.

These life expectancy figures may be of particular use in monitoring and investigating health inequality issues across Scotland and in setting public health targets, particularly when used in conjunction with the Scottish Index of Multiple Deprivation 2006.

2. Discussion of Results

Men have a shorter life expectancy than women both in Scotland generally and within each CHP, Urban Rural and Deprivation area. There is, however, much variation from place to place.

2.1 Life Expectancy by Urban Rural Classification

In the previous report in this series of publications ([Life Expectancy in Special Areas 2004-2006](#)) life expectancy in urban and rural areas was calculated using the Scottish Governments 2005-2006 Urban Rural Classification. This set of life expectancy figures are based on the 2007-2008 Urban Rural Classification.

[Table 1](#), [Table 6](#) and [Figure 1](#) show that the shortest male life expectancy at birth (73.5 years) was for men living in Large Urban areas. Remote Rural areas and Accessible Rural areas had the longest male life expectancy (77.2 years and 77.0 years respectively).

The pattern for women was very similar, although their life expectancy at birth was consistently higher. Women living in Large Urban areas had the shortest life expectancy (79.1 years) and those living in Rural areas – Remote and Accessible – had the longest (at 81.0 and 80.9 years respectively).

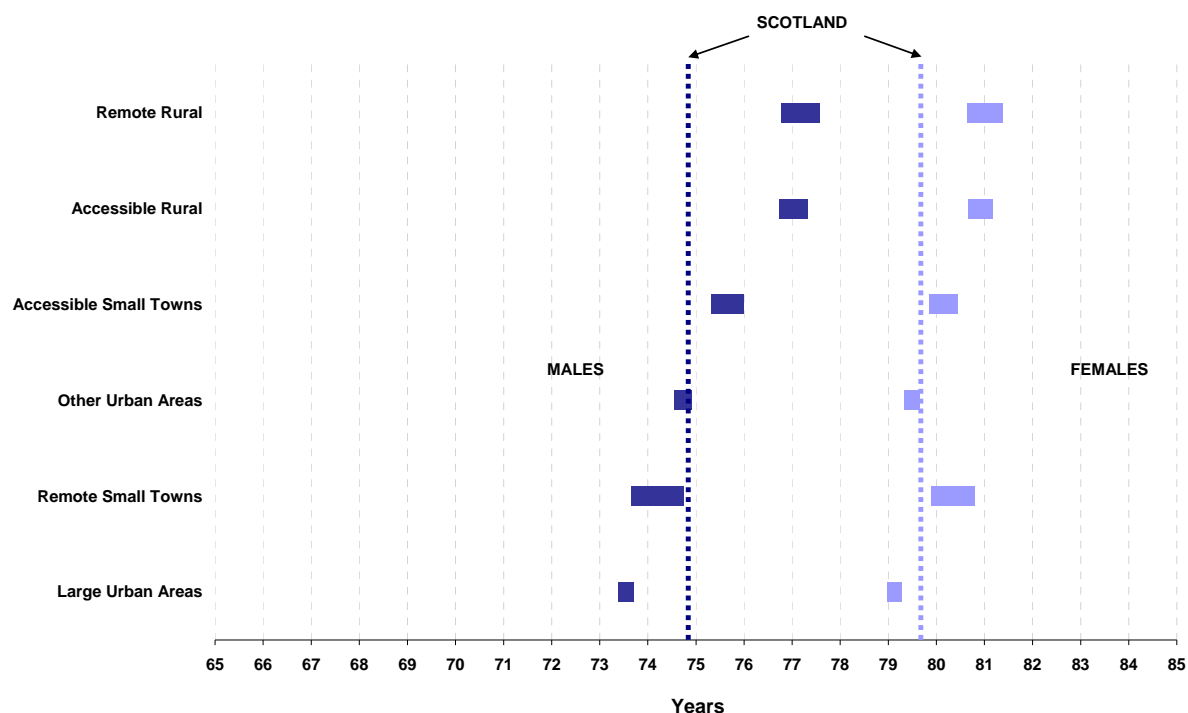

In all Urban and Rural areas, female life expectancy (at birth) was longer than male life expectancy. However, [Figure 1](#) shows the gap between male and female life expectancy was widest in Remote Small Towns, where men could expect to live 74.2 years from birth but women could expect to live 80.3 years – 6.1 years longer.

[Figure 1](#) also shows that people in Large Urban areas had a shorter life expectancy at birth than the Scottish average (for males, the difference was 1.3 years and for females 0.6 years). People living in Other Urban areas and men in Remote Small Towns also had shorter life expectancies at birth than the Scottish average, although the differences were smaller.

At the other end of the scale, people in Rural areas – remote and accessible – lived longer than the Scottish average (over 2 years extra for men and over 1 year extra for women).

The differences in life expectancy at age 65 were narrower, but 65 year old people living in Remote Rural areas could still look forward to a lifespan about 1 year longer than the Scottish average and up to 2.1 years beyond that of their counterparts in Large Urban areas.

Figure 1: Life expectancy at birth, 95 per cent confidence intervals for Scottish Urban Rural Classification areas, 2005-2007 (Males and Females)

2.2 Life Expectancy by Deprivation Area

Male and female life expectancy in each deprivation decile, quintile and vigintile is shown in [Table 2](#), [Table 3](#), [Table 4](#) and [Table 7](#). [Figure 2](#) illustrates male and female life expectancy (at birth) in each deprivation decile with 95 per cent confidence intervals.

Men in the 10 per cent least deprived areas of Scotland could expect to live (from birth) for 80.7 years – 13.4 years longer than in the 10 per cent most deprived areas (67.3 years).

Female life expectancy (at birth) shows the same pattern, although the gap between the most and least deprived areas is smaller than that for men. In the 10 per cent least deprived areas women could expect to live for 83.8 years – 8.8 years longer than in the 10 per cent most deprived areas (75.0 years).

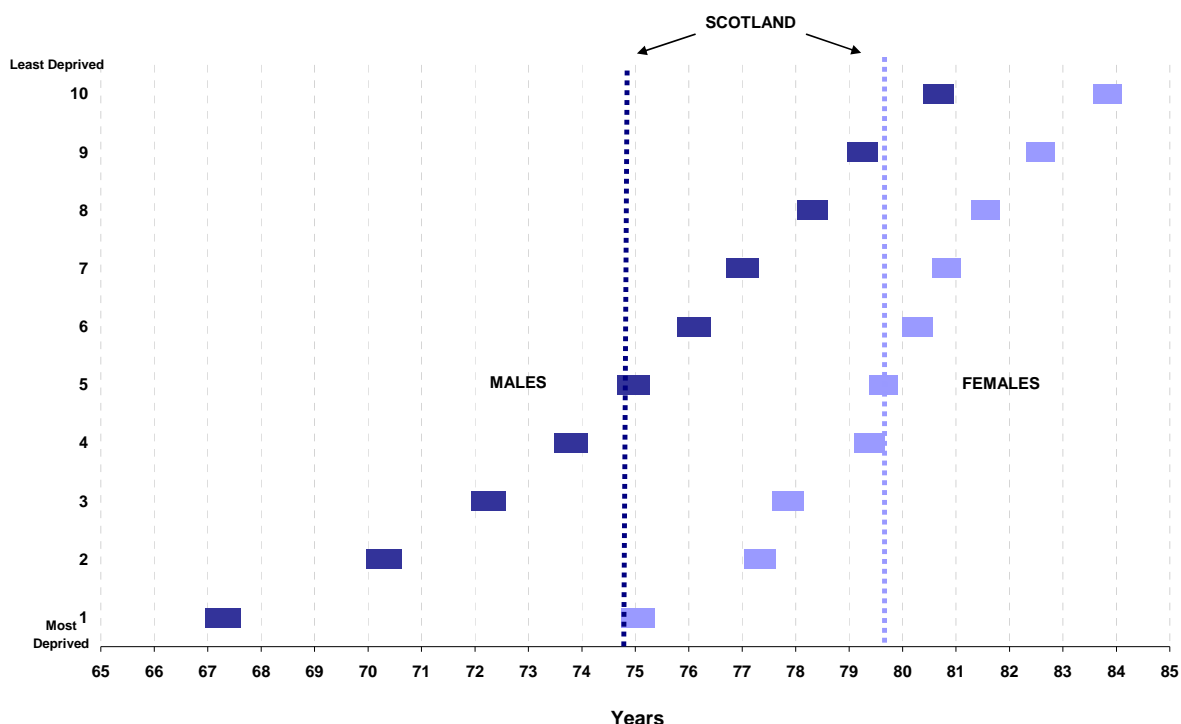

[Figure 2](#) shows a smooth trend of decreasing life expectancy with increasing deprivation. [Figure 2](#) also illustrates that, as deprivation decreased the gap between male and female life expectancy decreased. For example, in the 10 per cent most deprived areas, women could expect to live 7.7 years more than males but, in the 10 per cent least deprived areas, this gap was shortened to 3.1 years.

People in the 10 per cent most deprived areas had a shorter life expectancy at birth than the Scottish average (7.5 years less for men and 4.7 years less for women). On the other hand, people in the 10 per cent least deprived areas lived longer than the Scottish average (5.9 years more for men and 4.1 years more for women).

The differences in life expectancy at age 65 were narrower, but 65 year old people in the 10 per cent least deprived areas could still look forward to a lifespan around 2 years longer than

the Scottish average and around 4 to 5 years longer than their counterparts in the 10 per cent most deprived areas.

Figure 2: Life expectancy at birth, 95 per cent confidence intervals for Scottish Index of Multiple Deprivation 2006 Decile areas, 2005-2007 (Males and Females)

2.3 Life Expectancy by Community Health Partnership Area

2.3.1 Life Expectancy at birth and age 65, 2005-2007

Male and female life expectancy at birth, for each CHP area, is shown in [Table 5](#), [Table 8](#) and [Figure 3](#).

Male life expectancy was shortest for those living in East Glasgow, North Glasgow and Southwest Glasgow (69.3, 69.7 and 70.8 years respectively). Men living in these areas could expect a life span 5.5, 5.1 and 4.0 years (respectively) shorter than the Scottish average. Their counterparts in 13 other CHPs also had a lower life expectancy than the Scottish average (see [Figure 3](#)).

In contrast, male life expectancy was highest in East Dunbartonshire (78.0 years), Aberdeenshire (77.5 years), and East Renfrewshire (77.4 years) – 3.2, 2.7 and 2.6 years (respectively) longer than the Scottish average. This is consistent with the figures published in [Life Expectancy for Administrative Areas within Scotland, 2005-2007](#), in September 2008, which showed that the council area with the shortest life expectancy was Glasgow City and that East Dunbartonshire had the longest life expectancy.

Women in each CHP area had longer life expectancy at birth than men. North Glasgow, East Glasgow and Southwest Glasgow had the shortest female life expectancy at 76.2, 76.5 and 77.2 years. Women living in these areas could expect a shorter lifespan than the Scottish

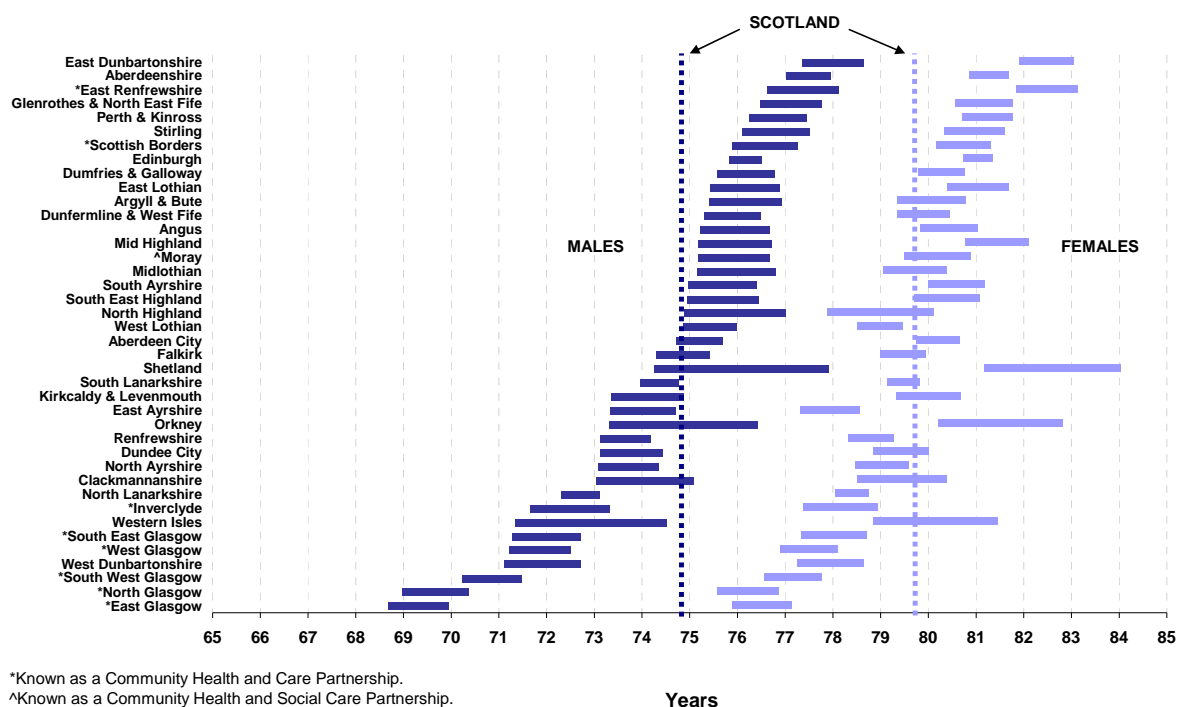

female average – by 3.5, 3.2 and 2.5 years respectively. A further 14 CHPs also had a lower life expectancy than the Scottish average (see [Figure 3](#)).

At the opposite end of the scale, Shetland had the longest female life expectancy at 82.6 years, followed by East Renfrewshire and East Dunbartonshire (both 82.5 years) – almost 3 years longer than the Scottish average. Again this matched the picture at council area level.

The gap between the CHP with the shortest male life expectancy at birth and the CHP with the longest was 8.7 years. This gap was narrower for females at 6.4 years.

The differences in life expectancy at age 65 were narrower, but 65 year old men living in Shetland could still look forward to a lifespan 2.3 years longer than the Scottish average and 5.1 years longer than men living in East Glasgow. Similarly, 65 year old women living in Shetland could look forward to a lifespan 2.2 years longer than the Scottish average and 4.3 years longer than their counterparts in North Glasgow.

Figure 3: Life expectancy at birth 95, per cent confidence intervals for Scottish Community Health Partnership Areas, 2005-2007 (Males and Females)

2.3.2 Comparison between 1996-1998 and 2005-2007

[Table 9](#) and [Table 10](#) show the highest to lowest ranking CHP areas, in terms of male and female life expectancy at birth, and change over time. Figure 4 (link below) illustrates the change in male and female life expectancy, in each CHP area, over a 9 year period¹ (from 1996-1998 to 2005-2007).

[Figure 4: Life expectancy at birth, with 95 per cent lower and upper confidence intervals, 1996-1998 to 2005-2007, for males and females in each Community Health Partnership area](#)

[Table 9](#), [Table 10](#) and [Figure 4](#) shows that life expectancy at birth, based on the period 2005-2007, has improved for all 40 CHP areas (for both males and females) when compared to that based on the period 1996-1998; however, as [Figure 4](#) shows, for some CHPs this improvement has not been on a year-to-year basis, rather life expectancy has risen and fallen throughout the 9 year period. These fluctuations are most evident in smaller CHPs where the numbers are fewer (for example, Shetland and Orkney) and are likely to be due to random variation in the number of deaths (and the age at death) from one year to the next rather than actual changes in life expectancy.

The last column in [Table 9](#) and [Table 10](#) presents percentage change in life expectancy over the 9 year period for each CHP area. For males, the largest increase in life expectancy at birth was in Shetland with 5.5 per cent (an improvement of 4.0 years). East Ayrshire had the lowest increase with 1.3 per cent (an improvement of 1.0 years). For females, Shetland also saw the largest increase in life expectancy at birth with 3.9 per cent (an improvement of 3.1 years) and Moray the lowest with 0.3 per cent (an improvement of 0.3 years).

The gap between the area with the highest life expectancy at birth and the area with the lowest has increased over the 9-year period by 0.1 years for males (from 8.6 years in 1996-1998 to 8.7 years in 2005-2007) and 0.6 years for females (from 5.8 years in 1996-1998 to 6.4 years in 2005-2007).

The gap between male and female life expectancy narrowed for all but 9 CHPs. There was no change in the gap between male and female life expectancy at birth between 1996-1998 and 2005-2007 for Clackmannanshire and South Lanarkshire, and there was a widening of the gap for South East Glasgow, Kirkcaldy & Levenmouth, Dundee City, East Glasgow, North Lanarkshire, East Renfrewshire and Orkney. The largest decrease in the gap between male and female life expectancy over the 9 year period was in North Highland, where the gap halved (from 6.2 years to 3.1 years).

¹ When comparing life expectancy over time, the standard approach taken by GROS is to compare over a 10 year period. Due to data constraints life expectancy at CHP level is only calculated back to 1996-1998, and so, a 9 year period is used in this instance.

3. Accuracy of Results

Life expectancy, like most statistics, is an estimate which is subject to a margin of error. The accuracy of the results can be indicated by calculating a confidence interval which provides a range of values within which the true underlying life expectancy would lie (with 95 per cent probability).

The 95 per cent confidence intervals for life expectancy at birth are given in [Table 6](#), [Table 7](#) and [Table 8](#), and are illustrated in [Figure 1](#), [Figure 2](#), [Figure 3](#) and [Figure 4](#) for Urban/Rural Classification, Deprivation Decile and Community Health Partnership areas within Scotland.

There is no simple ‘rule of thumb’ for the size of confidence intervals. But they largely depend on the size of the population, so confidence intervals for areas with small populations tend to be wider. It is also worth noting that life expectancy results in these areas can be affected by the random variation in the number of annual deaths. This means that the results can be erratic and vary from year to year.

More information about the methods used to calculate the standard errors and confidence intervals used in this report can be found in the Office for National Statistics methodology paper [Life expectancy at birth: methodological options for small populations](#).

4. Life expectancy Notes and Definitions

The figures quoted in this publication are all period life expectancies. Period life expectancies are calculated using age specific mortality rates for a given period, with no allowance for any actual or projected future changes in mortality. This means that period life expectancy at birth for a given time period and area is an estimate of the average number of years a new born baby would survive if he/she experienced the particular area’s age specific mortality rates for that time period throughout his/her life. The figure reflects mortality among those living in the area in each period, rather than mortality among those born in each area. Life expectancy at birth is not the number of years a baby born in the area during the three year period is expected to live (although the term “can expect to live” is used throughout this publication for ease of reading), both because death rates are likely to change in the future and because many of the new borns may live elsewhere for at least some part of their lives.

This publication gives expectation of life at an “exact age”. This is the average number of years that those at this age would survive thereafter – if they experienced the particular area’s age specific mortality rates for that time period throughout the remainder of their life. These extracts from period life tables (found in [Table 1](#), [Table 2](#), [Table 3](#), [Table 4](#) and [Table 5](#)) are constructed from the estimated population in 2005, 2006 and 2007 and the total number of deaths registered in these years.

The column headed l_x shows the numbers who would survive to the exact age of x , out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2005-2007. The column headed e_x^o shows the expectation of life – that is, the average number of years of life left to persons aged exactly x who are subject to the 2005-2007 mortality probabilities from age x onwards. For example, 76.7 per cent of the male population and 86.3 per cent of the female population of Large Urban areas could be expected to survive to age 65. A male aged 65 living in a Large Urban area could be expected to live on average another 15.4 years, and a female aged 65 could be expected to live on average another 18.5 years.

Please note that this report uses the 2008 Urban-Rural Classification, whereas the previous report in this series of publications ([Life Expectancy in Special Areas 2004-2006](#)) uses the 2006 Urban Rural Classification.

Comparison of the 2004-2006 life expectancy figures in Urban Rural areas with the 2005-2007 figures is sensible if the objective is, for example, to compare the area classed as Large Urban in the former to the area classed as Large Urban in the latter. If, however, the objective is to compare the area that was classed as Large Urban in the former with the exact same area based on 2005-2007 death records then the life expectancy figures for the period 2005-2007 based on the 2005-2006 Urban Rural classification would be needed – these are available on request.

Further information on the methodology is given in Section 4 of the [Life Expectancy for Administrative Areas within Scotland, 2005-2007](#) publication.

Table 1: Abridged life table, by sex, age and Urban Rural classification, Scotland 2005-2007

Note: This abridged life table is constructed from the estimated population in 2005, 2006 and 2007 and the total number of deaths registered in these years. The column headed l_x shows the numbers who would survive to the exact age of x , out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2005-2007. Column e_x^o shows the expectation of life, that is, the average number of years of life left to persons aged exactly x who are

¹ Please note that the Scotland-level life expectancy estimate shown here is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics: [National Statistics Online - Interim Life tables](#)

Note: This abridged life table is constructed from the estimated population in 2005, 2006 and 2007 and the total number of deaths registered in these years. The column headed l_x shows the numbers who would survive to the exact age of x, out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2005-2007. Column e_x^o shows the expectation of life, that is, the average number of years of life left to persons aged exactly x who are subject to the 2005-2007 mortality probabilities from age x onwards.

¹ Please note that the Scotland-level life expectancy estimate shown here is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics: [National Statistics Online - Interim Life tables](#)

Table 4: Abridged life table, by sex, age and deprivation vigintile, Scotland 2005-2007

Note: This abridged life table is constructed from the estimated population in 2005, 2006 and 2007 and the total number of deaths registered in these years. The column headed l_x shows the numbers who would survive to the exact age of x, out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2005-2007.

Column e_x^o shows the expectation of life, that is, the average number of years of life left to persons aged exactly x who are subject to the 2005-2007 mortality probabilities from age x onwards.

¹ Please note that the Scotland-level life expectancy estimate shown here is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics: [National Statistics Online - Interim Life tables](#)

Table 5: Abridged life table, by sex, age and Community Health Partnership, Scotland 2005-2007

80	42,033	6.8	64,497	8.4
85	23,136	5.2	45,543	5.9

Note: This abridged life table is constructed from the estimated population in 2005, 2006 and 2007 and the total number of deaths registered in these years. The column headed l_x shows the numbers who would survive to the exact age of x , out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2005-2007. Column e_x^o shows the expectation of life, that is, the average number of years of life left to persons aged exactly x who are subject to the 2005-2007 mortality probabilities from age x onwards.

¹ Please note that the Scotland-level life expectancy estimate shown here is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics: [National Statistics Online - Interim Life tables](#)

5. Notes on Statistical Publications

ENQUIRIES ABOUT THIS PUBLICATION Enquiries should be addressed to: Statistics Customer Services, General Register Office for Scotland, Ladywell House, Edinburgh, EH12 7TF Telephone: (0131) 314 4299, Fax: (0131) 314 4696, E-mail: customer@gro-scotland.gsi.gov.uk.

NATIONAL STATISTICS This is a National Statistics publication. It has been produced to high professional standards set out in the National Statistics Code of Practice and Release Practice Protocol (www.statistics.gov.uk/about_ns/cop/default.asp). These statistics undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political interference.

THE GENERAL REGISTER OFFICE FOR SCOTLAND (GROS) GROS is the devolved Government department in Scotland responsible for the registration of births, marriages, civil partnerships, deaths, divorces and adoptions in Scotland. We are responsible for the Census of Population in Scotland which we use, with other sources of information, to produce population and household statistics. We make available important information for family history. Our website is www.gro-scotland.gov.uk/.

OTHER GROS STATISTICS Further detailed statistics produced by GROS are available from the statistics pages of the GROS website (www.gro-scotland.gov.uk/statistics/index.html). Statistics from the 2001 Census are on the Scotland's Census Results On-Line website (www.scrol.gov.uk) and on the Census section of the main website (www.gro-scotland.gov.uk/census/index.html).

Information about future publications is provided on the GROS website (www.gro-scotland.gov.uk/futurepb.html). If you would like to receive notification of statistical publications, you can register your interest on The Scottish Government's ScotStat web site at www.scotland.gov.uk/Topics/Statistics/scotstat/Intro.

COMPLAINTS AND SUGGESTIONS If you are not satisfied with our service, please write to Kirsty MacLachlan, Head of Demography Division, Room 1/2/7, Ladywell House, Ladywell Road, Edinburgh, EH12 7TF, Telephone: (0131) 314 4242, E-mail: kirsty.maclachlan@gro-scotland.gsi.gov.uk.

We also welcome any comments or suggestions that would help us to improve our standards of service.
