

**Table 3 - Increased winter mortality<sup>1,2</sup> and increased winter mortality index<sup>3,4</sup>, by age group and NHS Board<sup>p</sup> area of usual residence, 2000/01 to 2009/10**

**Notes:**

1. Increased winter mortality has been defined as the difference between the number of deaths in the months December - March and the average of the preceding (August - November) and following (April - July) non-winter periods. A negative figure occurs when there were fewer deaths during the winter period than the average of the two "non-winter" periods.
  2. Because of the approximate nature of this measure, numbers have been rounded independently to the nearest 10. The sum of the age group figures may therefore appear to differ from the "all ages" total.
  3. The IWM Index is the (unrounded) number of "additional" winter deaths divided by the (unrounded) average number of deaths in a four month "non-winter" period, expressed as a percentage.
  4. The IWM Index has not been calculated when the number of "additional" winter deaths was negative.
  5. Figures for "Greater Glasgow & Clyde" and "Highland" include deaths in the relevant parts of the former NHS Argyll and Clyde area.
- (P). Data for the latest year are provisional.
