**Life Expectancy in Special Areas (Urban/Rural,
Deprivation and Community Health Partnership) within
Scotland, 2006-2008**

Published on 25 March 2010

Corrected on 16 September 2010

Corrections

Life Expectancy estimates by Scottish Index of Multiple Deprivation (SIMD) 2009 have been corrected after an error was found in the income domain of SIMD 2009. This affects the SIMD 2009 income domain and overall SIMD 2009. The corrections are in bullet points 4 and 5 on page 1 and within section 2.2 on page 5. Table 2, Table 3, Table 4 and Table 7 have been changed, as has Figure 2. The impact of correcting this error was small; a change of 0.5 years for some estimates. For further information see the [Scottish Index of Multiple Deprivation](#) section of the Scottish Government website.

Main Points

- Men in rural areas – remote and accessible – can expect to live over 3.5 years longer (77.2 and 77.5 years respectively) than men in large urban areas (73.7 years).
- Women in rural areas – remote and accessible – can expect to live around 2 years longer (81.4 and 81.2 years respectively) than women in large urban areas (79.3 years).
- Life expectancy decreases as deprivation increases.
- Men in the 10 per cent least deprived areas of Scotland can expect to live for 13.5 years more than men in the 10 per cent most deprived areas (80.8 years compared with 67.3 years).
- Women in the 10 per cent least deprived areas of Scotland can expect to live 9.1 years longer than those in the 10 per cent most deprived areas (84.2 years compared with 75.1 years).
- Men in East Dunbartonshire Community Health Partnership area can expect to live over 8 years longer than men in North and East Glasgow Community Health and Care Partnership areas (78.0 years compared to 69.4 and 69.6 years respectively).
- Women in East Dunbartonshire Community Health Partnership area can expect to live around 6 years longer than women in North and East Glasgow Community Health and Care Partnership areas (82.5 years compared to 76.0 and 76.8 years respectively).
- In the 10 years since 1996-1998, life expectancy at birth has increased in every Community Health Partnership area, although in 11 cases by a margin so small or non-significant that it may be a consequence of the volatile nature of life expectancy estimates in small areas.
- For men, the largest increase in life expectancy at birth, over the 10 year period, was in West Lothian with 5.7 per cent (an improvement of 4.1 years) and for women in East Dunbartonshire with 3.8 per cent (an improvement of 3.0 years).
- The gap of 8.6 years between the area with the highest male life expectancy at birth and the area with the lowest has not changed over the 10 year period; for females it has increased by 0.7 years (from 5.8 years in 1996-1998 to 6.5 years in 2006-2008).
- The gap between male and female life expectancy narrowed in all but 6 of the Community Health Partnership areas. The largest decrease (2.2 years) was in North Highland (4.0 years in 2006-2008 compared to 6.2 years in 1996-1998).

1. Introduction

This publication summarises the Registrar General for Scotland's life expectancy figures for the following "special areas" within Scotland:

- **Urban and Rural Areas**

The urban-rural split used in this publication is based on the Scottish Government's 6-fold Urban Rural Classification version 2007-2008. The differences between the 2005-2006 and the 2007-2008 classifications stem from changes to either settlement populations or settlement boundaries. The definitions of urban and rural areas underlying the classification are unchanged. For more information visit [Scottish Government Urban Rural Classification 2007-2008](#).

The 6-fold classification distinguishes between urban, rural and remote areas within Scotland. It is consistent with the Government's definition of rurality and includes the following categories:

1) Large Urban	Settlements of over 125,000 people.
2) Other Urban	Settlements of 10,000 to 125,000 people.
3) Accessible Small Towns	Settlements of between 3,000 and 10,000 people and within 30 minutes drive of a settlement of 10,000 or more.
4) Remote Small Towns	Settlements of between 3,000 and 10,000 people and with a drive time of over 30 minutes to a settlement of 10,000 or more.
5) Accessible Rural	Settlements of less than 3,000 people and within 30 minutes drive of a settlement of 10,000 or more.
6) Remote Rural	Settlements of less than 3,000 people and with a drive time of over 30 minutes to a settlement of 10,000 or more.

- **Deprivation areas**

Deprivation areas are based on the Scottish Index of Multiple Deprivation (SIMD) 2009 developed by the Scottish Government (<http://www.scotland.gov.uk/SIMD>). The SIMD ranks the 6,505 Scottish data zones (areas of compact shape and similar social characteristics, with populations of around 795 people) from 1 (most deprived) to 6,505 (least deprived). The SIMD rank can be split into vigintiles, deciles and quintiles. Life expectancy figures for deprivation areas have been presented in this way.

- **Community Health Partnerships**

There are currently 40 Community Health Partnerships (CHPs) organisations in Scotland. They are responsible for managing community health services and have developed existing links between community and hospital-based health services and local authority services such as social work, housing, leisure and education. Their principal aim is to improve the long-term health and wellbeing of communities and enhance the quality of health and social care services. In some areas, such as Glasgow, the Partnerships are responsible for many local social care services and are therefore called Community Health and Care Partnerships

(CHCPs) or Community Health and Social Care Partnerships (CHSCPs) and are run jointly by the NHS with local Council partners.

The Scotland-level life expectancy estimate shown in this publication is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics(ONS): [National Statistics Online - Interim Life tables](#).

Life expectancy statistics for each Council and NHS Board area were given in [Life Expectancy for Administrative Areas within Scotland, 2006-2008](#) published by General Register Office for Scotland (GROS) on 25 September 2009. Section 4 of that publication provides further information on national and sub-national life expectancy and healthy life expectancy.

The life expectancy figures in this publication may be of particular use in monitoring and investigating health inequality issues across Scotland and in setting public health targets, particularly when used in conjunction with the SIMD 2009.

2. Results

Men have a shorter life expectancy than women both in Scotland generally and within each CHP, Urban Rural and Deprivation area. There is, however, much variation from place to place.

Please note that differences in life expectancy estimates are calculated using rounded estimates.

2.1 Life Expectancy by Urban Rural Classification

[Table 1](#), [Table 6](#) and [Figure 1](#) show that the shortest male life expectancy at birth (73.7 years) was for men living in Large Urban areas. Accessible Rural areas and Remote Rural areas had the longest male life expectancy (77.5 years and 77.2 years respectively).

The pattern for women was very similar, although their life expectancy at birth was invariably higher. Women living in Large Urban areas had the shortest life expectancy (79.3 years) and those living in Rural areas – Remote and Accessible – had the longest (81.4 years and 81.2 years respectively).

In all Urban and Rural areas, female life expectancy (at birth) was longer than male life expectancy. However, [Figure 1](#) shows the gap between male and female life expectancy was widest in Remote Small Towns, where men could expect to live 74.3 years from birth but women could expect to live 80.1 years, 5.8 years longer.

[Figure 1](#) also shows that people in Large Urban areas had a shorter life expectancy at birth than the Scottish average (for males, the difference was 1.4 years and for females 0.6 years). People living in Other Urban areas and men in Remote Small Towns also had shorter life expectancies at birth than the Scottish average, although the differences were smaller.

At the other end of the scale, people in Rural areas – remote and accessible – lived longer than the Scottish average (over 2 years extra for men and over 1 year extra for women).

The differences in life expectancy at age 65 were narrower, but 65 year old people living in Remote Rural areas could still look forward to a lifespan about 1 year longer than the Scottish average and up to 2.1 years beyond that of their counterparts in Large Urban areas.

Figure 1: Life expectancy at birth, 95 per cent confidence intervals for Scottish Urban Rural Classification areas, 2006-2008 (males and females)

2.2 Life Expectancy by Deprivation Area

In the previous report in this series of publications ([Life Expectancy in Special Areas, 2005-2007](#)) life expectancy in deprivation areas was calculated using the Scottish Index of Multiple Deprivation (SIMD) 2006. This set of life expectancy figures are based on the SIMD 2009.

The SIMD measures deprivation. So at the lower end of the rankings (i.e. decile 10, vigintile 20 and quintile 5) all that can be said is that there is less deprivation. The SIMD does not measure affluence so it is not possible to say that one area is more affluent than another. Therefore, the life expectancy figures presented by deprivation area in this report should not be translated as ‘life expectancy of the rich versus that of the poor’. Instead it should be viewed in terms of ‘differences in life expectancy in relation to the amount of concentrated deprivation’.

It should also be noted that not all people living in deprived areas are deprived and not all deprived people live in deprived areas.

Male and female life expectancy in each deprivation decile, quintile and vigintile is shown in [Table 2](#), [Table 3](#), [Table 4](#) and [Table 7](#). [Figure 2](#) illustrates male and female life expectancy (at birth) in each deprivation decile with 95 per cent confidence intervals.

Men in the 10 per cent least deprived areas of Scotland (decile 10) could expect to live (from birth) for 80.8 years, 13.5 years longer than in the 10 per cent most deprived areas (67.3 years).

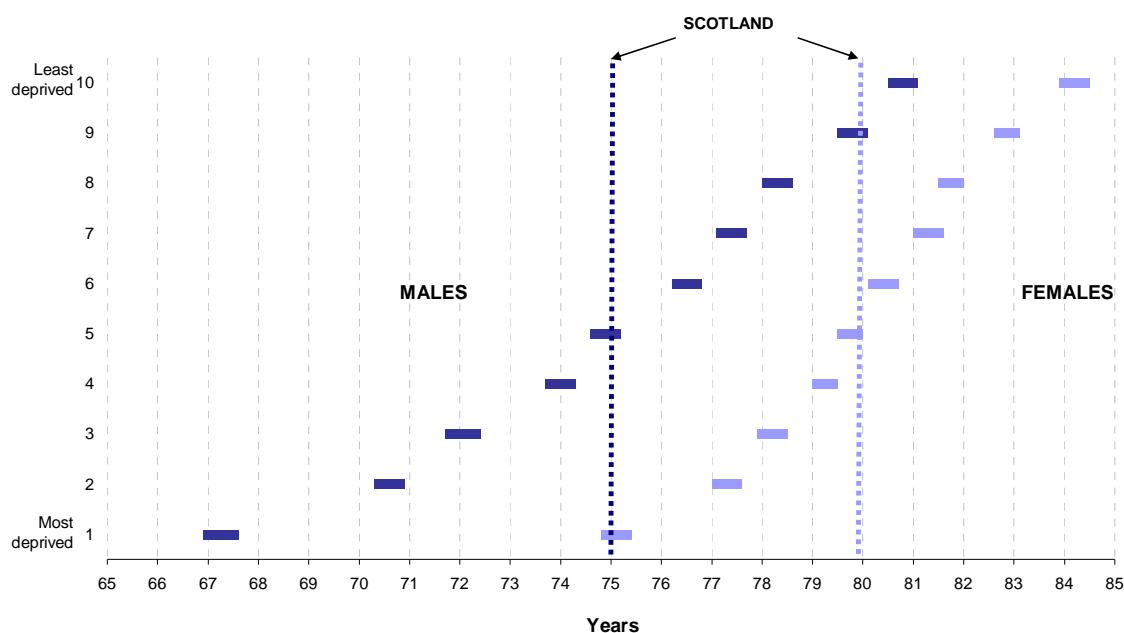

Female life expectancy (at birth) shows the same pattern, although the gap between the most and least deprived areas is smaller than that for men. In the 10 per cent least deprived areas women could expect to live for 84.2 years, 9.1 years longer than in the 10 per cent most deprived areas (75.1 years).

Figure 2 shows a smooth trend of decreasing life expectancy with increasing deprivation. Figure 2 also illustrates that, as deprivation decreased the gap between male and female life expectancy decreased. For example, in the 10 per cent most deprived areas, women could expect to live 7.8 years more than men but, in the 10 per cent least deprived areas, this gap was shortened to 3.4 years.

People in the 10 per cent most deprived areas had a shorter life expectancy at birth than the Scottish average (7.7 years less for men and 4.8 years less for women). On the other hand, people in the 10 per cent least deprived areas lived longer than the Scottish average (5.8 years more for men and 4.3 years more for women).

The differences in life expectancy at age 65 were narrower, but 65 year old people in the 10 per cent least deprived areas could still look forward to a lifespan longer than the Scottish average (by 2.7 years for men and 2.6 years for women) and could expect to live longer than their counterparts in the 10 per cent most deprived areas by 5.4 years for men and by 4.6 years for women.

Figure 2: Life expectancy at birth, 95 per cent confidence intervals for SIMD2009 Decile areas, 2006-2008 (males and females)

2.3 Life Expectancy by Community Health Partnership (CHP) Area

2.3.1 Life Expectancy at birth and age 65, 2006-2008

Male and female life expectancy at birth, for each CHP area, is shown in [Table 5](#), [Table 8](#) and [Figure 3](#).

Male life expectancy was shortest for those living in North Glasgow, East Glasgow and Southwest Glasgow (69.4, 69.6 and 71.1 years respectively). Men living in these areas could expect a life span 5.7, 5.5 and 3.9 years (respectively) shorter than the Scottish average. Men in 9 other CHPs also had significantly lower life expectancy than the Scottish average i.e. the confidence intervals did not overlap with that of the Scottish average (see [Figure 3](#)).

In contrast, male life expectancy was highest in East Dunbartonshire at 78.0 years, 3 years longer than the Scottish average. Glenrothes & North East Fife, Perth & Kinross and Aberdeenshire followed closely at 77.5 years, 2.5 years longer than the Scottish average.

This is consistent with the figures published in [Life Expectancy for Administrative Areas within Scotland, 2006-2008](#), in September 2009, which showed that the council area with the shortest life expectancy was Glasgow City and that East Dunbartonshire had the longest life expectancy.

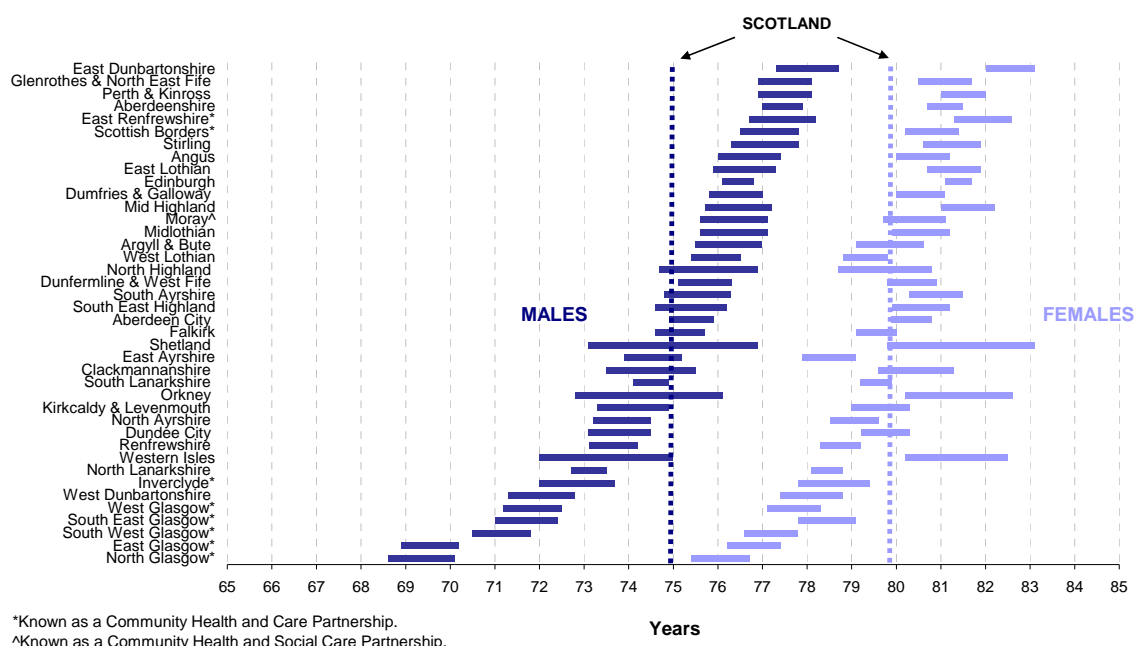

Women in each CHP area had longer life expectancy at birth than men. North Glasgow, East Glasgow and Southwest Glasgow had the shortest female life expectancy at 76.0, 76.8 and 77.2 years. Women living in these areas could expect a shorter lifespan than the Scottish female average by 3.9, 3.1 and 2.7 years respectively. Women in a further 8 CHPs also had a significantly lower life expectancy than the Scottish average i.e. the confidence intervals did not overlap with that of the Scottish average (see [Figure 3](#)).

At the opposite end of the scale, East Dunbartonshire had the longest female life expectancy at 82.5 years, followed by East Renfrewshire (82.0 years) and Mid Highland (81.6 years), around 2 years longer than the Scottish average. Again this reflected the picture at council area level.

The gap between the CHP with the shortest male life expectancy at birth and the CHP with the longest was 8.6 years. This gap was narrower for females at 6.5 years.

The differences in life expectancy at age 65 were narrower, but 65 year old men living in Shetland could still look forward to a lifespan 1.6 years longer than the Scottish average and 4.6 years longer than men living in North Glasgow. Similarly, 65 year old women living in Shetland could look forward to a lifespan 1.5 years longer than the Scottish average and 3.8 years longer than women in North Glasgow.

Figure 3: Life expectancy at birth, 95 per cent confidence intervals for Scottish Community Health Partnership areas, 2006-2008 (males and females)

2.3.2 Comparison between 1996-1998 and 2006-2008

Table 9 and Table 10 show the highest to lowest ranking CHP areas, in terms of male and female life expectancy at birth, and change over time. Figure 4 (link below) illustrates the change in male and female life expectancy, in each CHP area, over a 10 year period (from 1996-1998 to 2006-2008).

[Figure 4: Life expectancy at birth, with 95 per cent lower and upper confidence limits, 1996-1998 to 2006-2008, for males and females in each Community Health Partnership area](#) is available on the GROS website.

Table 9, Table 10 and Figure 4 show that, when confidence intervals are taken into account, life expectancy at birth, based on the period 2006-2008 has significantly improved for the majority of CHP areas (for both males and females), when compared to that based on the period 1996-1998. However, improvements over the 10 year period in the male and female life expectancy of smaller CHP areas – Orkney, Shetland, Western Isles, and North Highland – are not significant, as indicated by the overlapping confidence intervals (see section 3 for a further explanation of confidence intervals). This is also the case for male life expectancy in South East Glasgow and Clackmannanshire and female life expectancy in Moray, Inverclyde and North Ayrshire.

For example, in Moray, female life expectancy at birth based on the period 1996-1998 was estimated to be 79.9 years, and in 2006-2008 it was 80.4 years, an apparent improvement of 0.5 years. However the upper confidence limit for female life expectancy in Moray in 1996-1998 was 80.6 years, 0.2 years higher than the estimated life expectancy in 2006-2008, and therefore the apparent increase in life expectancy over time was not statistically significant.

[Figure 4](#) also shows that, for some CHPs, improvements in life expectancy over the 10 year period have not been on a year-to-year basis. Instead life expectancy has risen and fallen throughout the 10 year period. These fluctuations are most evident in smaller CHPs where the numbers are fewer (for example, Shetland and Orkney) and are likely to be due to random variation in the number of deaths (and the age at death) from one year to the next rather than actual changes in life expectancy.

The last column in [Table 9](#) and [Table 10](#) presents percentage change in estimated life expectancy over the 10 year period for each CHP area. For males, the largest increase in life expectancy at birth was in West Lothian with 5.7 per cent (an improvement of 4.1 years). Orkney had the lowest increase with 1.4 per cent (an improvement of 1.1 years), but this was not a significant increase. For females, East Dunbartonshire saw the largest increase in life expectancy at birth with 3.8 per cent (an improvement of 3.0 years). Moray saw the lowest increase in female life expectancy with 0.6 per cent (an improvement of 0.5 years), but this was not a significant increase.

The gap of 8.6 years between the area with the highest male life expectancy at birth and the area with the lowest has not changed over the 10 year period; however, for females it has increased by 0.7 years (from 5.8 years in 1996-1998 to 6.5 years in 2006-2008).

The gap between male and female life expectancy within a CHP area narrowed for all but 6 CHPs between 1996-1998 and 2006-2008. The largest decrease (2.2 years) was in North Highland (4.0 years in 2006-2008 compared to 6.2 years in 1996-1998). Of the CHPs where the gap between male and female life expectancy widened over the 10 year period Orkney experienced the largest increase at 1.4 years (7.0 years in 2006-2008 compared to 5.6 years in 1996-1998); however, this may just be a consequence of the volatile nature of life expectancy estimates in small areas.

3. Accuracy of Results

Life expectancy, like most statistics, is an estimate which is subject to a margin of error. The accuracy of the results can be indicated by calculating a confidence interval which provides a range of values within which the true underlying life expectancy would lie (with 95 per cent probability). Life expectancy for an area can be said to be significantly different from e.g. the Scottish level if the 95% confidence intervals do not overlap.

The 95 per cent confidence intervals for life expectancy at birth are given in [Table 6](#), [Table 7](#) and [Table 8](#), and are illustrated in [Figure 1](#), [Figure 2](#), [Figure 3](#) and [Figure 4](#) for Urban/Rural Classification, Deprivation Decile and Community Health Partnership areas within Scotland.

There is no simple 'rule of thumb' for the size of confidence intervals. But they largely depend on the size of the population, so confidence intervals for areas with small populations tend to be wider. It is also worth noting that life expectancy results in these areas can be affected by the random variation in the number of annual deaths. This means that the results can be erratic and vary from year to year.

More information about the methods used to calculate the standard errors and confidence intervals used in this report can be found in the Office for National Statistics methodology paper [Life expectancy at birth: methodological options for small populations](#).

4. Life Expectancy Notes and Definitions

The figures quoted in this publication are all period life expectancies. Period life expectancies are calculated using age specific mortality rates for a given period, with no allowance for any actual or projected future changes in mortality. This means that period life expectancy at birth for a given time period and area is an estimate of the average number of years a new born baby would survive if he/she experienced the particular area's age specific mortality rates for that time period throughout his/her life. The figure reflects mortality among those living in the area in each period, rather than mortality among those born in each area. Life expectancy at birth is not the number of years a baby born in the area during the three year period is expected to live (although the term "can expect to live" is used throughout this publication for ease of reading), both because death rates are likely to change in the future and because many of the new borns may live elsewhere for at least some part of their lives.

This publication gives expectation of life at an "exact age". This is the average number of years that those at this age would survive thereafter, if they experienced the particular area's age specific mortality rates for that time period throughout the remainder of their life. These extracts from period life tables (found in [Table 1](#), [Table 2](#), [Table 3](#), [Table 4](#) and [Table 5](#)) are constructed from the estimated population in 2006, 2007 and 2008 and the total number of deaths registered in these years.

The column headed l_x shows the numbers who would survive to the exact age of x , out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2006-2008. The column headed e_x^o shows the expectation of life – that is, the average number of years of life left to persons aged exactly x who are subject to the 2006-2008 mortality probabilities from age x onwards. For example, 76.9 per cent of the male population and 86.6 per cent of the female population of Large Urban areas could be expected to survive to age 65. A male aged 65 living in a Large Urban area could be expected to live on average another 15.6 years, and a female aged 65 could be expected to live on average another 18.6 years.

Please note that this report uses the SIMD 2009 to calculate life expectancy by deprivation, whereas the previous report in this series of publications ([Life Expectancy in Special Areas 2005-2007](#)) used the SIMD 2006.

Comparison of the 2005-2007 life expectancy figures in deprivation areas with the 2006-2008 figures is appropriate if the objective is, for example, to compare the area previously classed as most deprived to the area now classed as most deprived. If, however, the objective is to compare the area that was previously classed as most deprived with the exact same area based on 2006-2008 death records then the life expectancy figures for the period 2006-2008 based on the SIMD 2006 would be needed, these are available on request.

Links to further information on the methodology are given in Section 4 of the [Life Expectancy for Administrative Areas within Scotland, 2006-2008](#) publication.

Note: This abridged life table is constructed from the estimated population in 2006, 2007 and 2008 and the total number of deaths registered in these years. The column headed l_x shows the numbers who would survive to the exact age of x , out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2006-2008. Column e_x^o shows the expectation of life, that is, the average number of years of life left to persons aged exactly x who are subject to the 2006-2008 mortality probabilities from age x onwards.

¹ Please note that the Scotland-level life expectancy estimate shown here is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics: [National Statistics Online - Interim Life tables](#)

Table 2: Abridged life table, by sex, age and deprivation decile, Scotland 2006-2008

Note: This abridged life table is constructed from the estimated population in 2006, 2007 and 2008 and the total number of deaths registered in these years. The column headed l_x shows the numbers who would survive to the exact age of x, out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2006-2008. Column e_x^o shows the expectation of life, that is, the average number of years of life left to persons aged exactly x who are subject to the 2006-2008 mortality probabilities from age x onwards.

¹ Please note that the Scotland-level life expectancy estimate shown here is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics: [National Statistics Online - Interim Life tables](#)

Note: This abridged life table is constructed from the estimated population in 2006, 2007 and 2008 and the total number of deaths registered in these years. The column headed l_x shows the numbers who would survive to the exact age of x, out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2006-2008.

Column e_x^o shows the expectation of life, that is, the average number of years of life left to persons aged exactly x who are subject to the 2006-2008 mortality probabilities from age x onwards.

¹ Please note that the Scotland-level life expectancy estimate shown here is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics: [National Statistics Online - Interim Life tables](#)

Table 5: Abridged life table, by sex, age and Community Health Partnership, Scotland 2006-2008

Note: This abridged life table is constructed from the estimated population in 2006, 2007 and 2008 and the total number of deaths registered in these years. The column headed l_x shows the numbers who would survive to the exact age of x , out of 100,000 persons who, from birth, were subject to the mortality probabilities indicated by the death records for 2006-2008. Column e_x^o shows the expectation of life, that is, the average number of years of life left to persons aged exactly x who are subject to the 2006-2008 mortality probabilities from age x onwards.

¹ Please note that the Scotland-level life expectancy estimate shown here is for use only as a comparator for the corresponding sub-Scotland-level figures. The definitive Scotland-level life expectancy estimate (based on interim life tables) is published by the Office for National Statistics: [National Statistics Online - Interim Life tables](#)

Notes on statistical publications

National Statistics

This is a National Statistics publication. It has been produced to the high professional standards set out in the UK Statistics Authority Code of Practice for Official Statistics (<http://www.statisticsauthority.gov.uk/assessment/code-of-practice/index.html>).

These statistics undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political interference.

Enquiries

Enquiries about this publication should be addressed to:

Statistics Customer Services,

General Register Office for Scotland,

Ladywell House,

Edinburgh,

EH12 7TF.

Telephone: (0131) 314 4299

E-mail: customer@gro-scotland.gsi.gov.uk

General Register Office for Scotland

The General Register Office for Scotland (GROS) is the department of the devolved Scottish Administration responsible for the registration of births, marriages, civil partnerships, deaths, divorces and adoptions in Scotland. We are responsible for the Census of Population in Scotland which we use, with other sources of information, to produce population and household statistics. We make available important information for family history. The GROS website is <http://www.gro-scotland.gov.uk>. Our aim is to provide relevant and reliable information, analysis and advice that meet the needs of government, business and the people of Scotland.

Further detailed statistics produced by GROS are available from the Statistics Section on the GROS website (<http://www.gro-scotland.gov.uk/statistics/index.html>).

Statistics from the 2001 Census are on Scotland's Census Results On-Line website (<http://www.scrol.gov.uk>) and on the Census section of the GROS website

(<http://www.gro-scotland.gov.uk/census/index.html>).

Information about future publications is provided on the GROS website

(<http://www.gro-scotland.gov.uk/futurepb.html>). If you would like to receive

notification of forthcoming statistical publications, you can register your interest on the Scottish Government ScotStat website at <http://www.scotland.gov.uk/scotstat>.

Comments and complaints

If you are not satisfied with our service, please write to Kirsty MacLachlan, Head of Demography Division, General Register Office for Scotland, Room 1/2/7, Ladywell House, Ladywell Road, Edinburgh EH12 7TF. Telephone: (0131) 314 4242,

E-mail: kirsty.maclachlan@gro-scotland.gsi.gov.uk.

We also welcome any comments or suggestion that would help us to improve our standards of service.
