

# POPULATION AND MIGRATION STATISTICS COMMITTEE (SCOTLAND)

## PROPOSAL FOR DISSEMINATING MIGRATION DATA

### Introduction

This paper sets forth proposals for disseminating migration data held by the demography branch by publishing it on the GROS website. PAMS is asked to note the paper and offer comments. Written comments will also be welcome to [esta.clark@gro-scotland.gsi.gov.uk](mailto:esta.clark@gro-scotland.gsi.gov.uk).

### Background

The General Register Office for Scotland (GROS) prepares an estimate of migration for the purpose of producing population estimates. Currently the total net migration for a council area and health board is published in a "components of change" table as part of the mid-year estimates publication and the text refers to the rest of UK and overseas migration breakdown. More detailed migration data is available on request through GROS customer services. In recent years the volume of requests for this data in, usually, different aggregations has increased. Therefore, for this and other reasons it makes sense to publish as much of the data as possible.

### Migration Data

As you may know migration is derived from three key sources of data. The National Health Service Central Register (NHSCR) for moves between health boards within the UK, with migration at council area level within Scotland estimated using anonymised data from the Community Health Index (CHI). The International Passenger Survey (IPS) provides information on moves into and out of Scotland from outside the UK.

Migration data from these sources are aggregated together to give a net migration figure by single year of age and sex for each council and health board area. The method for doing this is explained in the paper PAMS (03) 10. The resulting figures are available on request from GROS customer services for 2001 onwards and it is proposed that this information should be put on the GROS website. Prior to 2001 migration estimates were made using electorate data and only the total net flows have been revised for 1981 to 2000 to take into account the results of the 2001 Census. The total net flows (which include other changes) for council and health boards are available on the GROS website through the following link: <http://www.gro-scotland.gov.uk/statistics/library/poptest/revised-mid-year-est.html>. Work is planned in the coming year to separate these net flows into in and out flows for rest of UK and overseas moves to provide a consistent time series from 1981 onwards. It is envisaged that data on these flows will be available from the GROS website in due course.

***Members are invited to comment on the proposal for publishing net migration by single year of age from 2001 to 2004 by council and health board area on the GROS website. And the medium-term proposal for publishing a historic time series back to 1981.***

As well as the information available for net flows there is also information available from the separate sources used to estimate the components of the total migration flows, as outlined below.

**NHSCR**

The NHSCR system records the movements of patients between NHS health board areas in the UK. Each time a patient transfers to a new NHS doctor in a different health board area, the NHSCR is notified and then the patient is considered to have made a migrant move. Counts of these re-registrations are used a proxy indicator for moves within the UK. Total flows are published for the UK and its constituent countries on a quarterly basis by the Office for National Statistics (ONS) and are available through the following link:

<http://www.statistics.gov.uk/StatBase/ssdataset.asp?vlnk=8906&Pos=1&ColRank=1&Rank=192>

As well as this published information more detailed information for health boards in Scotland is available from GROS customer services in the form of two standard tables for mid-year and calendar year periods:

R1 Tables - Movements of Patient Registration at the NHSCR. Area of destination by Area of Origin; Health Boards; Armed Forces; Rest UK.

R2 Tables – For each Health Board Area. Moves with other Health Board Areas; Rest UK and Armed Forces combined by Sex and Quinary Age.

Examples of these tables are shown in **Annex A**.

We have a consistent time series going back to 1996. It is proposed that in the short-term these tables from 1996 are put on to the GROS website in a low key way. It is envisaged that subsequent publications of the data will be every six months and will also be low key releases. In the medium to long-term it is hoped to publish a longer time series once work has been carried out to quality assure the historic data.

While we hold the NHSCR data for single year of age for each health board area it is not proposed to put this onto the GROS website in the short-term. Investigations need to be carried out into whether publishing the data in this form would allow an individual to be identified. This information is rarely requested at this level of detail and most customers are satisfied with aggregated results.

***Members are invited to comment on the proposals for publishing aggregated NHSCR data.***

**IPS based data**

The main source for overseas migration is the International Passenger Survey (IPS). The Office for National Statistics (ONS) publishes a calendar year estimate of Total International Migration (TIM) using a slightly different method from that used by GROS for the purpose of producing a mid-year population estimate. The latest information is for the calendar year 2003 and is available through the following link: [insert link]. This information is published in April every year.

GROS produce a mid-year estimate for international migration based on the IPS and other information from the Home Office. This is because the sample size for the IPS in Scotland is small (around 100 contacts per year). Part of the work of the National Statistics Quality Review (NSQR) of International Migration is to look at how international migrants are allocated to Scotland. Due to the limitations of the data an age and sex distribution is assumed for overseas migrants using health service data to give a distribution which is similar to migrants from the rest of the UK. This information has been

given out by age group and it is proposed that these tables are routinely produced for Scotland and health board areas and published on the GROS website. Example tables are shown in **Annex A**.

***Members are invited to comment on the proposals for publishing the tables by age group on the GROS website and give suggestions for what should be in the accompanying documentation.***

### **Community Health Index (CHI) migration data**

The Community Health Index (CHI) holds records of people registered with an NHS doctor in Scotland. Unlike the NHSCR, the records provided to GROS contain the postcode of the patient's address, which enables migration to be estimated for councils, and potentially for smaller areas. The approach used for estimating council-level migration involves matching CHI patient records which are extracted from a database which reflects the 'live' CHI system on two occasions one year apart.

This match of two extracts, say A and B, will create three sets of patients:

- Set of patients in extract A and extract B
- Set of patients in extract A but not in extract B
- Set of patients in extract B but not in extract A.

The set of patients in both extracts whose postcode were not in each extract can be considered as those within-Scotland migrants who moved from one address in Scotland to another within Scotland between the dates of the two extracts. The remaining two sets of patients are either migrants to or from Scotland; babies born between the two extracts; deaths between the dates of the two extracts; movements to or from the Armed Forces; and a small number of records that are for the same patient but have different CHI numbers because they could not be matched when the GP registration was processed.

Currently, GROS migration data derived from the NHSCR is considered to be the most reliable data available at health board level, so estimates from the CHI are controlled to ensure that they are consistent with the NHSCR data for moves across a health board boundary by origin, destination, age and sex.

GROS receive anonymised CHI records which are held securely in accordance with the agreement with the Directors of Public Health. Because of this, and the quality of the migration estimates below council and health board area it is not proposed to publish or release data at this level. However, it should be possible to publish a matrix of CHI council area migration data controlled to NHSCR migration data to show total moves between councils within Scotland and moves to/from councils to outside Scotland. Due to the way in which council area migration is produced it is not possible to separate out moves to the rest of the UK and overseas by council area. The method used to produce council area migration is described in paper PAMS (03) 10. The matrix which would be published would exclude the unmeasured migration error and rounding adjustments. Asylum seekers would be included. This information would be published annually after the mid-year estimates. An example matrix is in **Annex B**.

***Members are asked to comment on the proposal for publishing a council area migration matrix.***

## PAMS (05) 06 ANNEX B: Example of CHI migration matrix for council areas controlled to NHSCR health board moves.

### Note:

1. These figures do not include the migration error which was assigned following the 2001 Census. It is likely that most of this error is contained in international migration figures, and hence has little effect on internal migration within Scotland. Further information on the migration error can be obtained from the GROS website ([www.gro-scotland.gov.uk](http://www.gro-scotland.gov.uk)). Also, they do not include rounding adjustments.

### Council area migration flows mid-2003 to mid-2004
