**Footnotes**

- 1) Live births only. Excludes births where mother's age is not stated.
- 2) Rate for age 15 includes births at younger ages and for age 44 includes births at older ages.
- 3) Diagonals (1973 onwards) display fertility experience of individual female cohorts through time.
- 4) Completed family sizes for 1918 to 1923 birth cohorts include extrapolated estimates of fertility at younger ages (i.e. pre 1939 births).
- 5) The average age is calculated by adding 0.5 years to the mother's age at her last birthday (e.g. it is assumed that 30-year-old mothers were, on average, aged 30 years and 6 months when they gave birth).
