<sup>1</sup> Excludes births where mother's age is not stated.

<sup>2</sup> Rate for age 15 includes births at younger ages and for age 44 includes births at older ages.

<sup>3</sup> Diagonals (1973 onwards) display fertility experience of individual female cohorts through time.

<sup>4</sup> Completed family sizes for 1918 to 1923 birth cohorts include extrapolated estimates of fertility at younger ages (i.e. pre 1939 births).

<sup>5</sup> Live births only. The average age is calculated by adding 0.5 years to the mother's age at her last birthday (e.g. it is assumed that 30-year-old mothers were, on average, aged 30 years and 6 months when they gave birth).
